BULACAN STATE UNIVERSITY

College of Information and Communications Technology

System User Guide

Campus Equipment Borrowing and Inventory System

Illustrated instructions for Basic Users, Admin personnel and first-time evaluators

Submission detail	Value
Course / academic year	IT 401W - Web Programming and Frameworks | 2026-2027
Group	Group 1
Section and proponents	To be completed with the verified section, roster and student identifiers before submission.
Prepared snapshot	25 October 2026 | Python 3.13.7 | Django 6.1.2
Submitted to	Dr. Aaron Paul M. Dela Rosa, as named in the official project specification.

Evidence-qualified edition. This document describes the copied implementation and tests executed for run IT401W-G1-20261025. Unexecuted evaluations and unavailable academic records are explicitly identified.

1. Introduction and safe access

This system helps campus users request equipment and helps Admin personnel reserve exact physical units, issue them, receive returns and record repairs. A catalog item groups similar equipment; a physical unit is one individually identified asset. This guide describes the current working Django implementation, not a static prototype.

1.1 What you need

End users need a current browser, the application address and an active account. The course demonstration runs locally; ask the operator for the chosen local address. The examples use http://127.0.0.1:8000/, but the actual screenshots were captured at a separate loopback port (8787). Run the server before opening its address. A local address on one computer is not a public website accessible from another device.

The operator needs Python 3.13 and the dependencies in requirements.txt. Extract the ZIP, follow README and use python scripts/demo.py setup, verify and runserver for a separate fictional demonstration. Setup generates a private local password; the ZIP deliberately contains no credentials or database. Ordinary users do not need Python installed when using an already running deployment.

Role	What the role can do
Basic User	Browse active equipment, submit 1-3-item requests, track/cancel eligible own requests, view own loans/history and update personal profile.
Admin	Manage accounts/catalog/units, review requests, revise unissued approved due dates, release equipment, receive returns, manage maintenance, view reports/audit and borrowing settings.

Demonstration data
All people, email addresses and asset metadata in the screenshots are fictional. The fixed screenshots illustrate a 25 October 2026 snapshot; current counts, dates and record numbers on another run can differ. An empty history screenshot is an actual empty view, not missing or fabricated content.

1.2 Navigation and general controls

After sign-in, the system opens the portal for your campus role. Use the left navigation and page action buttons. On small screens, use the navigation toggle when shown. Search/filter controls narrow the current list; Reset filters returns to its default view. Pagination links keep applicable filters. Tables may scroll horizontally: focus the table region and use browser/keyboard scrolling rather than assuming hidden columns are absent.

Read labels as well as badge colors. Required fields show an asterisk. Invalid submissions display field or page errors and retain permitted entered values. Confirmation pages/dialogs are intended to be reviewed before saving. Do not repeatedly submit when a saving indicator is present. If another Admin has changed a record, reload and reassess the current state before retrying.

2. Getting started

2.1 Register a Basic User account

Navigation: Public page > Get Started or /register/

Use registration when you do not yet have a campus borrowing account.

1. Open the registration page and enter a unique Username and valid Email. Add First name, Last name and Contact number as appropriate.

2. Enter Password and Password confirmation. Follow the displayed Django password guidance; contact number is optional and accepts 7-15 digits with permitted formatting.

3. Use the registration submit button. If errors appear, correct the indicated fields and submit again.

Expected result: A valid new account has the Basic User role and enters its portal. Registration never creates an Admin.

Do not enter a real password into screenshots or shared documents. Deactivated accounts must contact an authorized Admin rather than register duplicate identities.

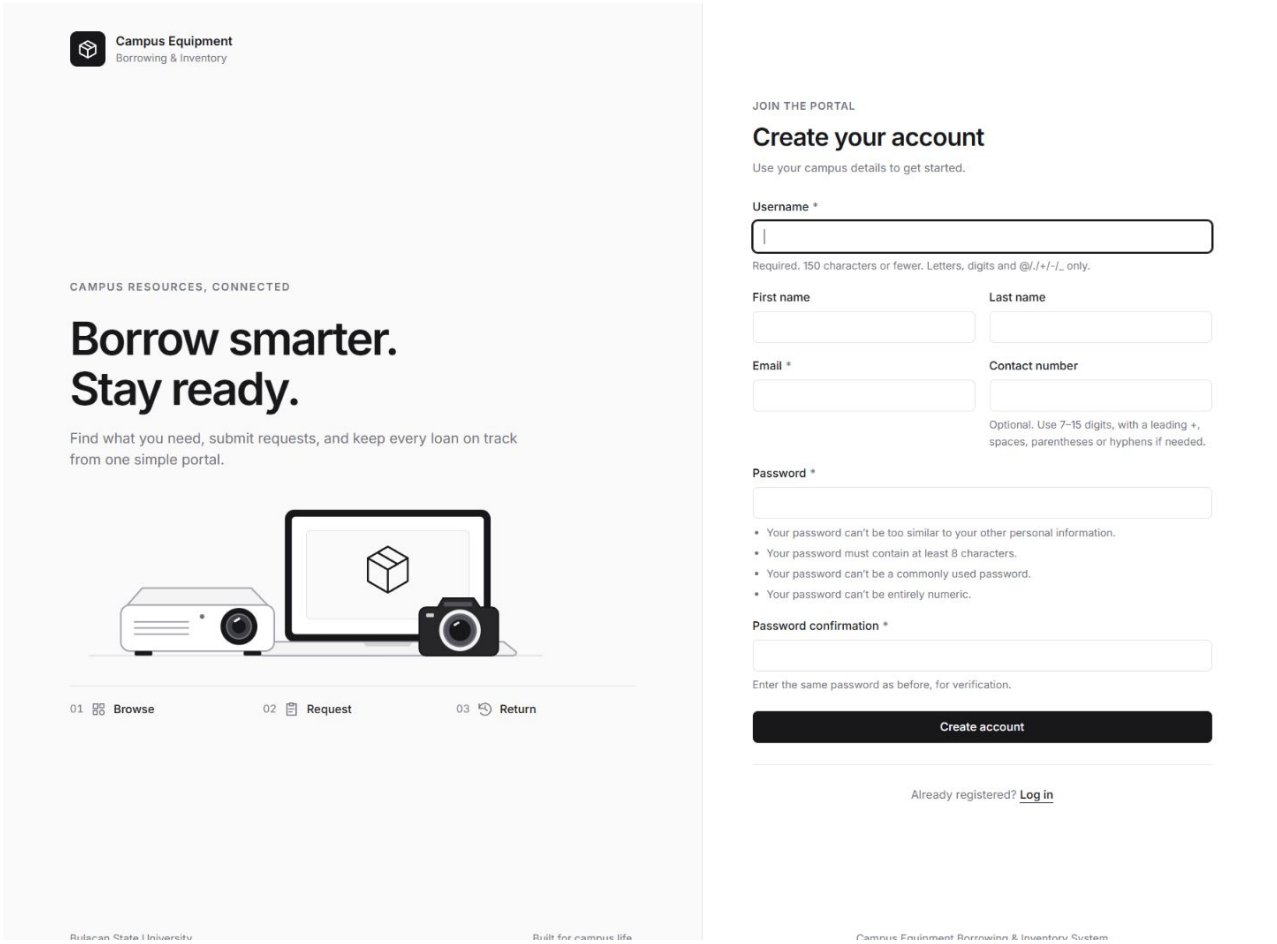

Figure 1. Registration fields and password guidance. Source: actual isolated application, 25 October 2026; fictional records.

2.2 Sign in

Navigation: /login/ > Log in

Use the same sign-in page for both campus roles.

1. Enter your Username and Password in the Log in form.

2. Select Log in once. Correct invalid credentials if the form displays an error.

3. Verify the correct portal: Basic User opens My Dashboard; Admin opens Dashboard.

Expected result: Only an active supported-role account signs in; its own portal is displayed.

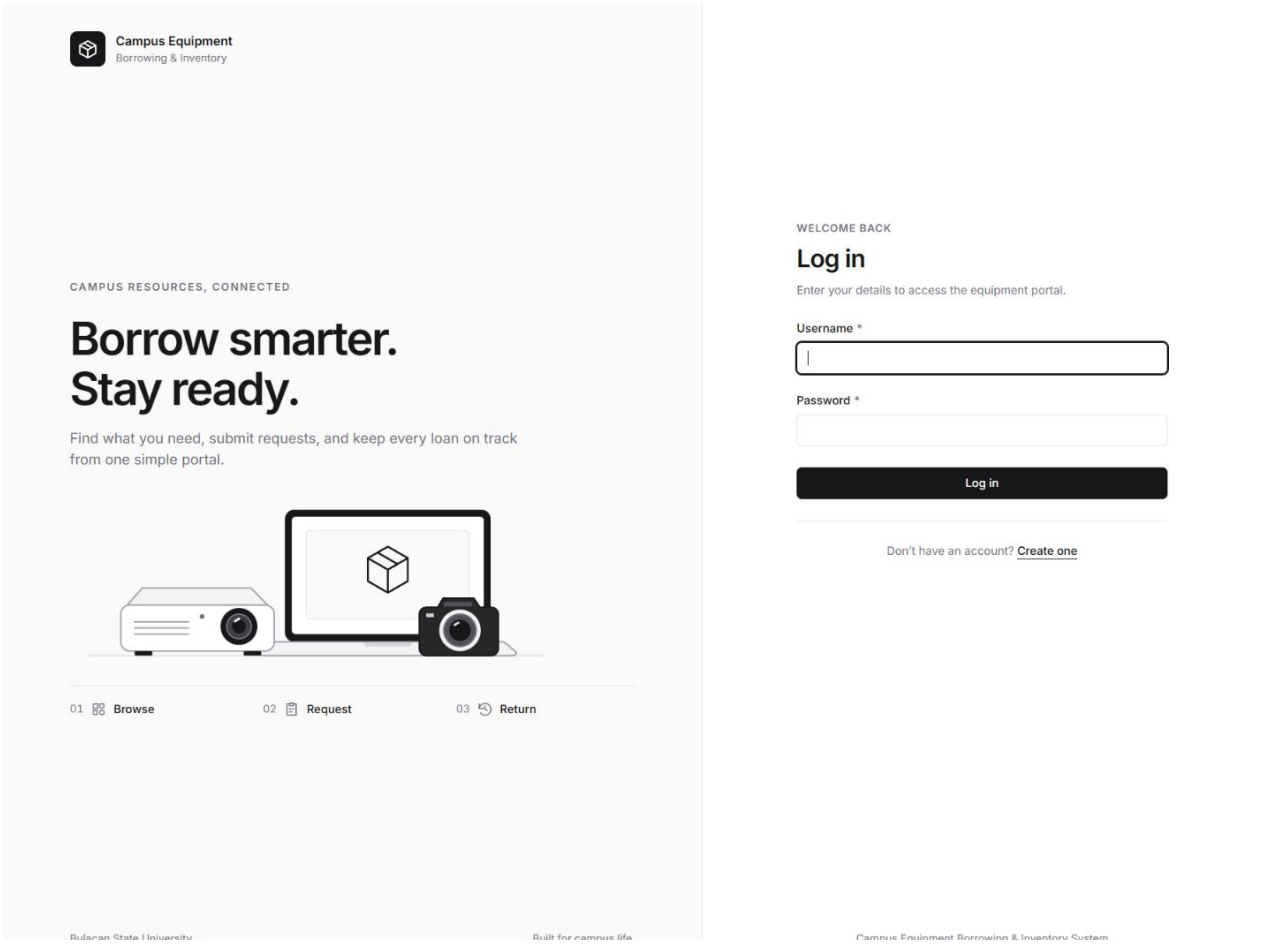

Figure 2. Actual sign-in screen with empty password field. Source: actual isolated application, 25 October 2026; fictional records.

2.3 Sign out safely

1. Choose Logout in the Account section of the sidebar.

2. Review the confirmation dialog. Choose Cancel to remain signed in, or Sign out to end the session.

3. After sign-out, protected portal pages require authentication again.

Expected result: Sign out ends the current session with a protected POST. If JavaScript is disabled, the ordinary logout form still signs out; its enhanced confirmation dialog may not appear. Close shared-browser sessions when finished.

3. Basic User portal

3.1 Open My Dashboard

Navigation: Main > Dashboard > /portal/

Review your own Pending requests, Awaiting release, Borrowed units, Overdue loans and upcoming due dates.

1. Choose Dashboard after sign-in.

2. Read the four personal count cards and Upcoming due dates table.

3. Use Browse equipment or the request/loan/history/profile shortcuts to continue.

Expected result: Only your own counts and records appear; another borrower's history is not included.

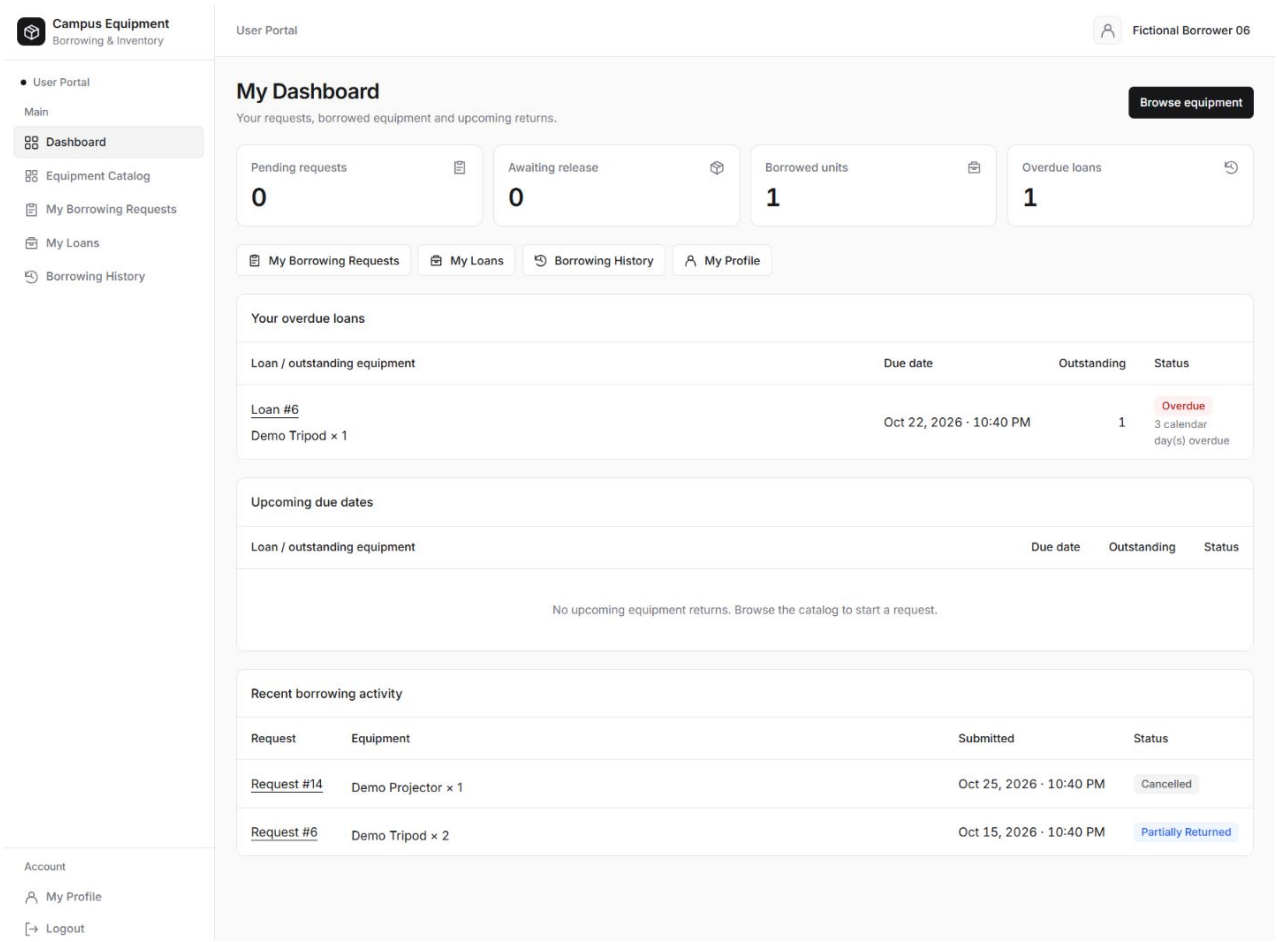

Figure 3. Personal dashboard and upcoming due dates. Source: actual isolated application, 25 October 2026; fictional records.

3.2 Browse, search and filter equipment

Navigation: Main > Equipment Catalog

Find currently active equipment and compare available/serviceable quantities before requesting.

1. Open Equipment Catalog. Enter an equipment name in Search equipment.

2. Choose Category and Availability as needed. These filters work together; use Reset filters to clear them.

3. Read category, equipment name, description, availability label and both inventory counts. Use pagination if multiple pages exist.

4. Choose Request equipment on an available item. An unavailable item has a muted unavailable action; do not try to bypass it.

Expected result: The list displays matching active catalog items; the selected available item carries into the request workflow.

Available is stock currently eligible to borrow. Total Serviceable includes Available, Reserved and Issued units; it excludes Maintenance and Retired. A serviceable unit may therefore be unavailable right now.

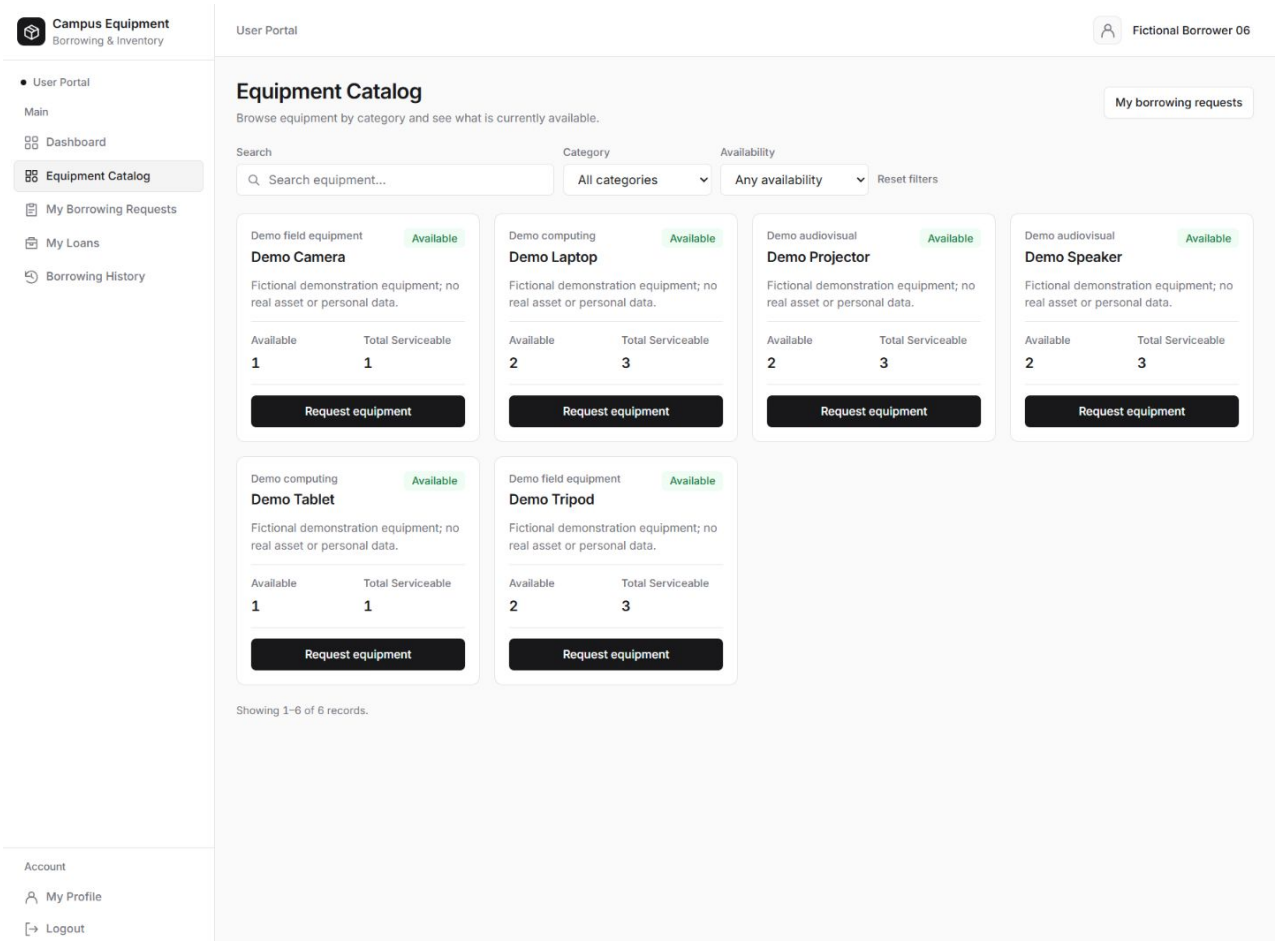

Figure 4. Active catalog filters, quantities and request actions. Source: actual isolated application, 25 October 2026; fictional records.

3.3 Read an equipment item

Navigation: Equipment Catalog > equipment name

Inspect a longer description and the same public inventory totals.

1. Select the equipment name in a catalog card.

2. Read its category, description, availability badge, Available Units and Total Serviceable.

3. When available, choose Request this equipment; otherwise return to the catalog to select another item.

Expected result: Public details remain readable without revealing internal physical tags or repair notes.

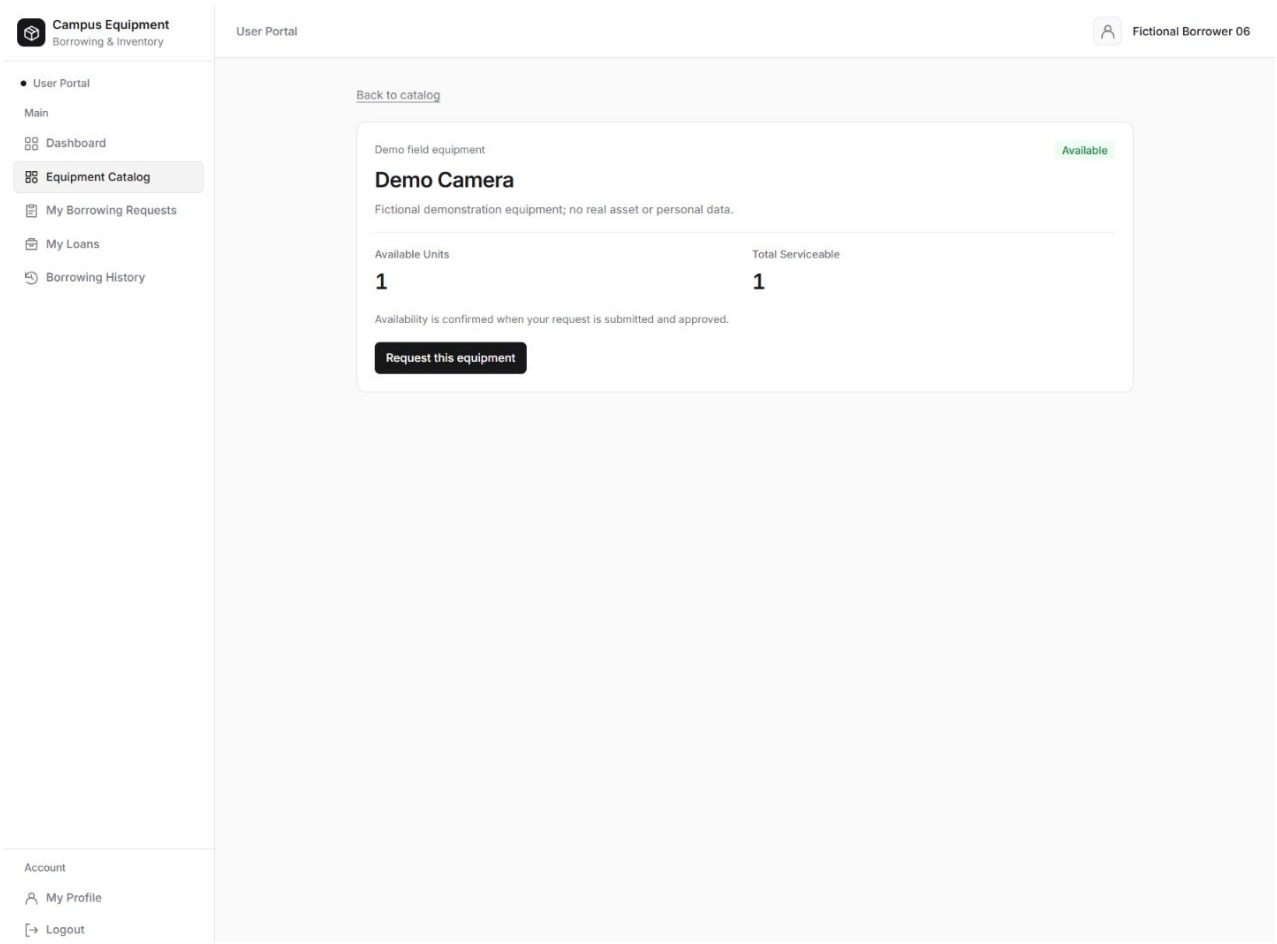

Figure 5. Simplified public equipment detail and availability statistics. Source: actual isolated application, 25 October 2026; fictional records.

3.4 Select equipment: Step 1

Navigation: Catalog > Request equipment, or My Borrowing Requests > New request > catalog

Choose one, two or three distinct catalog items. Three is a maximum, not a required number.

1. If you came from Request equipment, confirm the clicked item appears in the selected summary. Direct request navigation starts with no selection.

2. Use Add another equipment to open the searchable catalog when adding more. Search across categories and choose Add on available items.

3. Use Remove on unwanted selections. The same item cannot be added twice; zero-availability items cannot be selected.

4. Check the selected count (for example, 2 of 3), then choose Continue after at least one valid selection.

Expected result: The selected names move to Borrowing Details. No request or reservation is created by Continue.

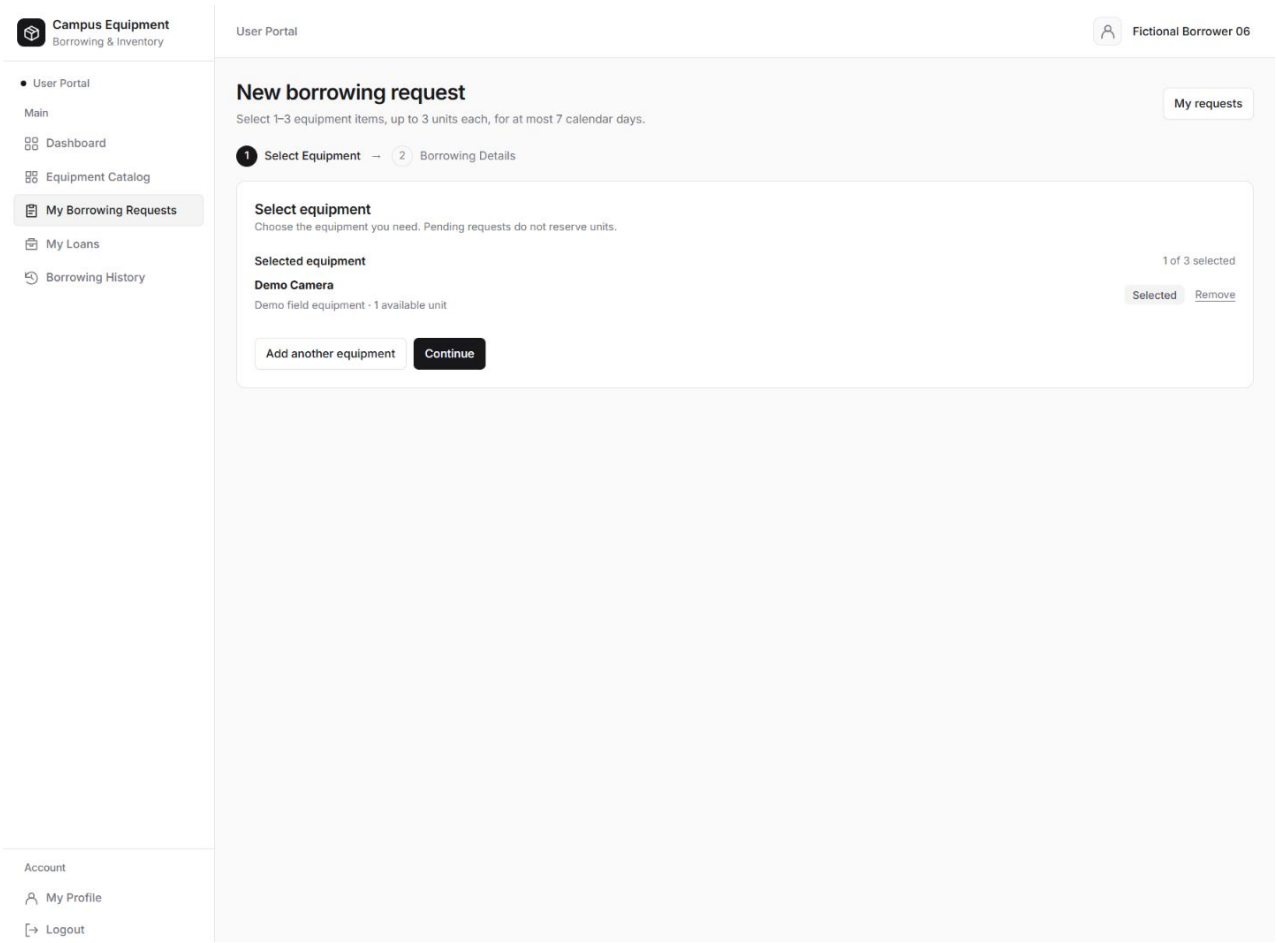

Figure 6. Step 1, with a preselected camera and compact selected summary. Source: actual isolated application, 25 October 2026; fictional records.

3.5 Enter quantities, purpose and desired due date: Step 2

Navigation: New Borrowing Request > Borrowing Details

Complete the final details without selecting the same equipment again.

1. Enter a positive Quantity for each selected item. Respect current availability and the displayed maximum per item (default 3).

2. Enter a specific Purpose and choose a future Due date within the displayed borrowing duration (default 7 calendar days from submission).

3. To change items, choose Back to Equipment Selection. Your quantities, purpose and date are retained; adjust items and Continue again.

4. Review the selected equipment and values, then choose Submit Borrowing Request once. Wait for the result; correct any current-availability or validation error.

Expected result: A valid submission creates your Pending request, reserves no physical units and redirects to its tracking record.

The screenshot shows entered fictional values before submission; it is not evidence that this browser session created a request. Automated cases separately verify successful submission and Pending/no-reservation behavior. Without JavaScript, use the server-rendered equipment selection form and its errors.

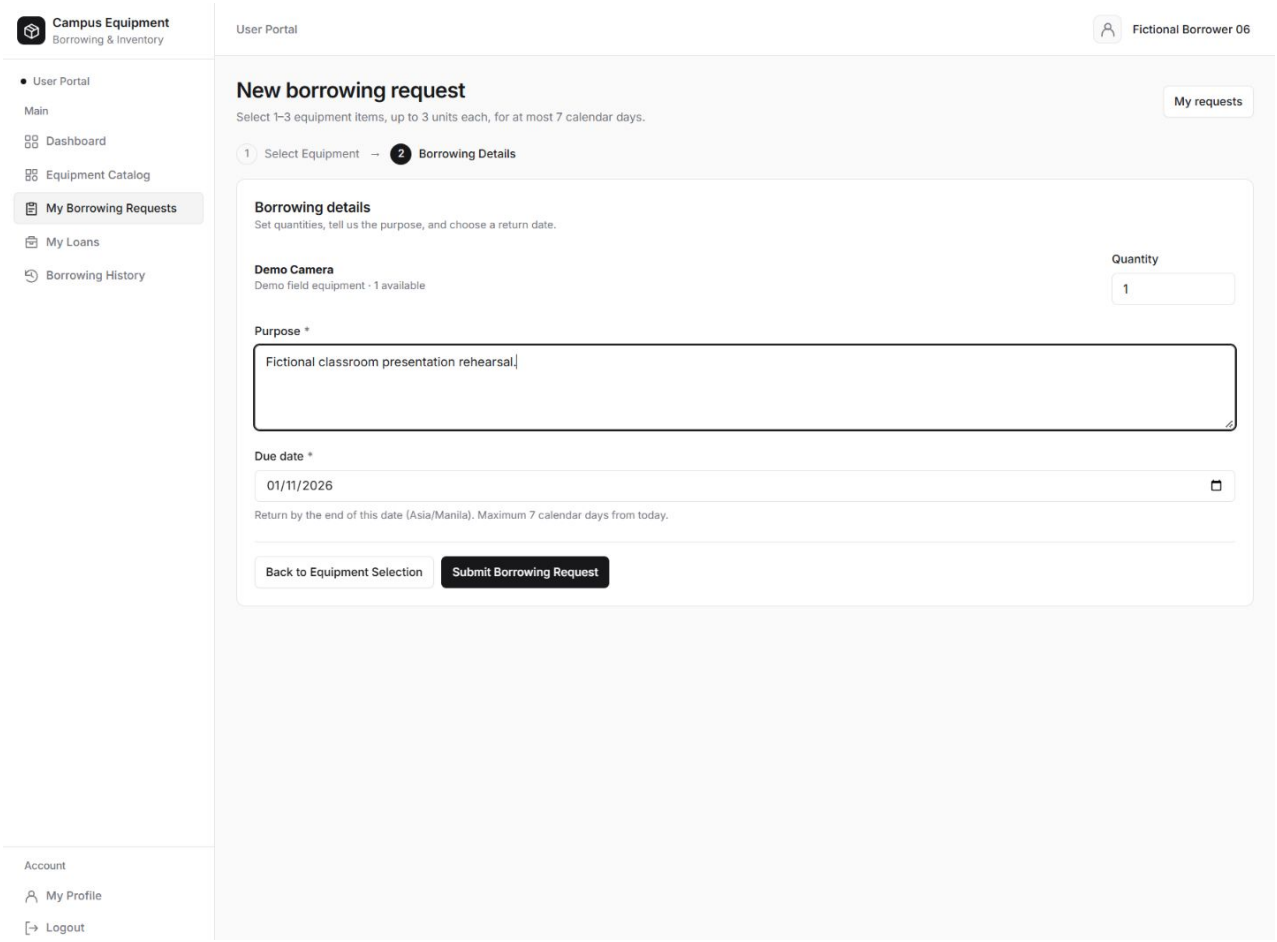

Figure 7. Step 2 with selected item quantity, purpose and desired date. Source: actual isolated application, 25 October 2026; fictional records.

3.6 Track and search your requests

Navigation: Main > My Borrowing Requests

Follow your own request from review to return.

1. Open My Borrowing Requests.

2. Search requests and choose a Status filter; use Reset filters when necessary.

3. Select the request record or its available view action to read its summary, equipment and timeline.

4. For a new request, choose New request; this opens Equipment Catalog so you can choose available equipment first.

Expected result: Only your own request rows appear, with current status, due date and permitted actions.

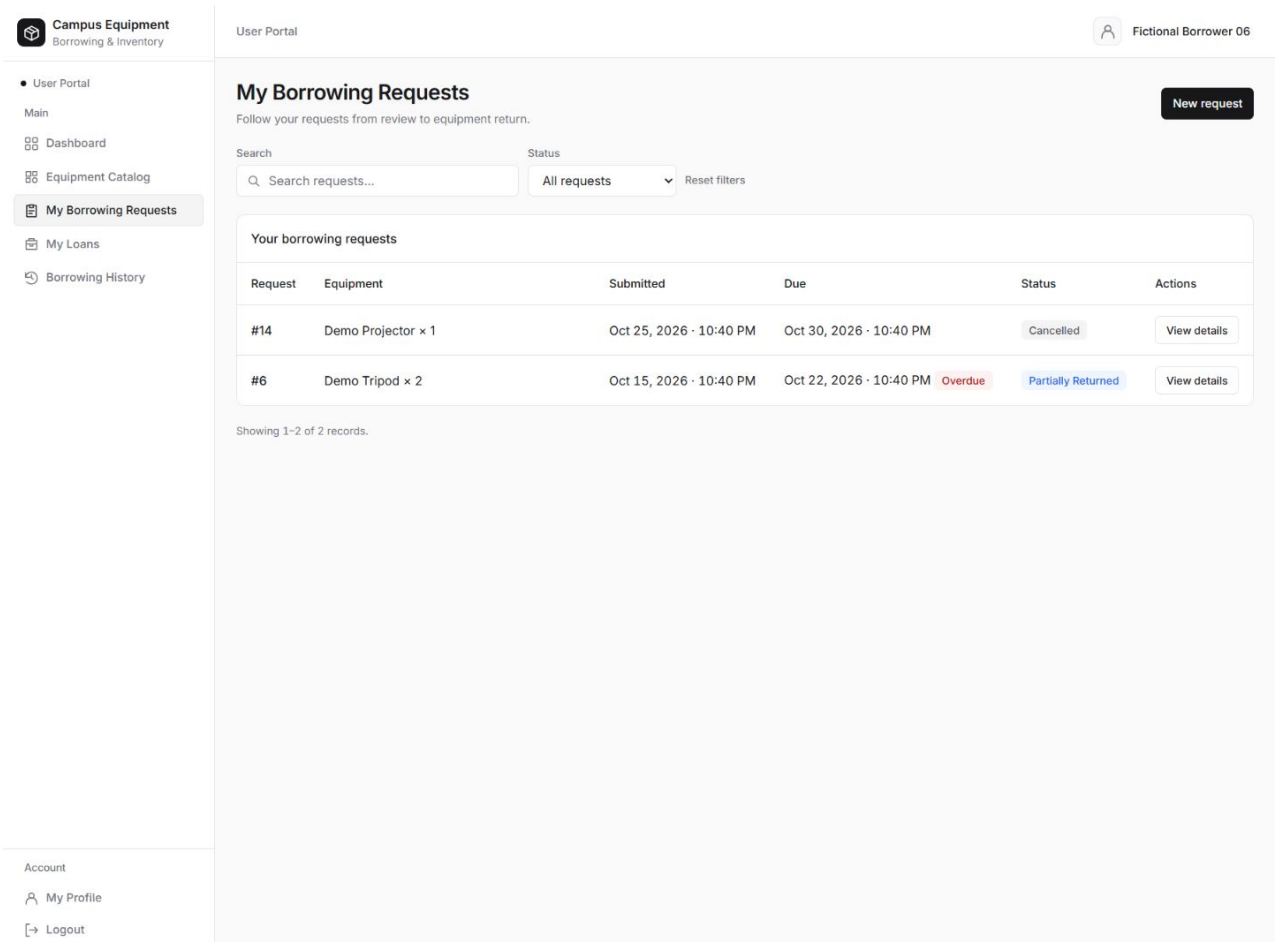

Figure 8. Own request list, including Partially Returned and Cancelled examples. Source: actual isolated application, 25 October 2026; fictional records.

3.7 Inspect or cancel an eligible request

Navigation: My Borrowing Requests > request record

Review the recorded purpose, quantities, dates and decision metadata before cancelling.

1. Open an owned request and read Request Summary.

2. For Pending or Approved requests before issue, choose Cancel request if shown.

3. Read and confirm cancellation on its confirmation interface. Stop if the record is no longer eligible.

4. Return to the request list to verify Cancelled. An Approved cancellation releases its reserved units.

Expected result: Eligible cancellation preserves history. Issued/Returned or another user's request cannot be cancelled.

The illustrated request is already issued/partially returned, so cancellation is intentionally unavailable. Basic Users cannot approve, revise an agreed due date, release equipment or record returns.

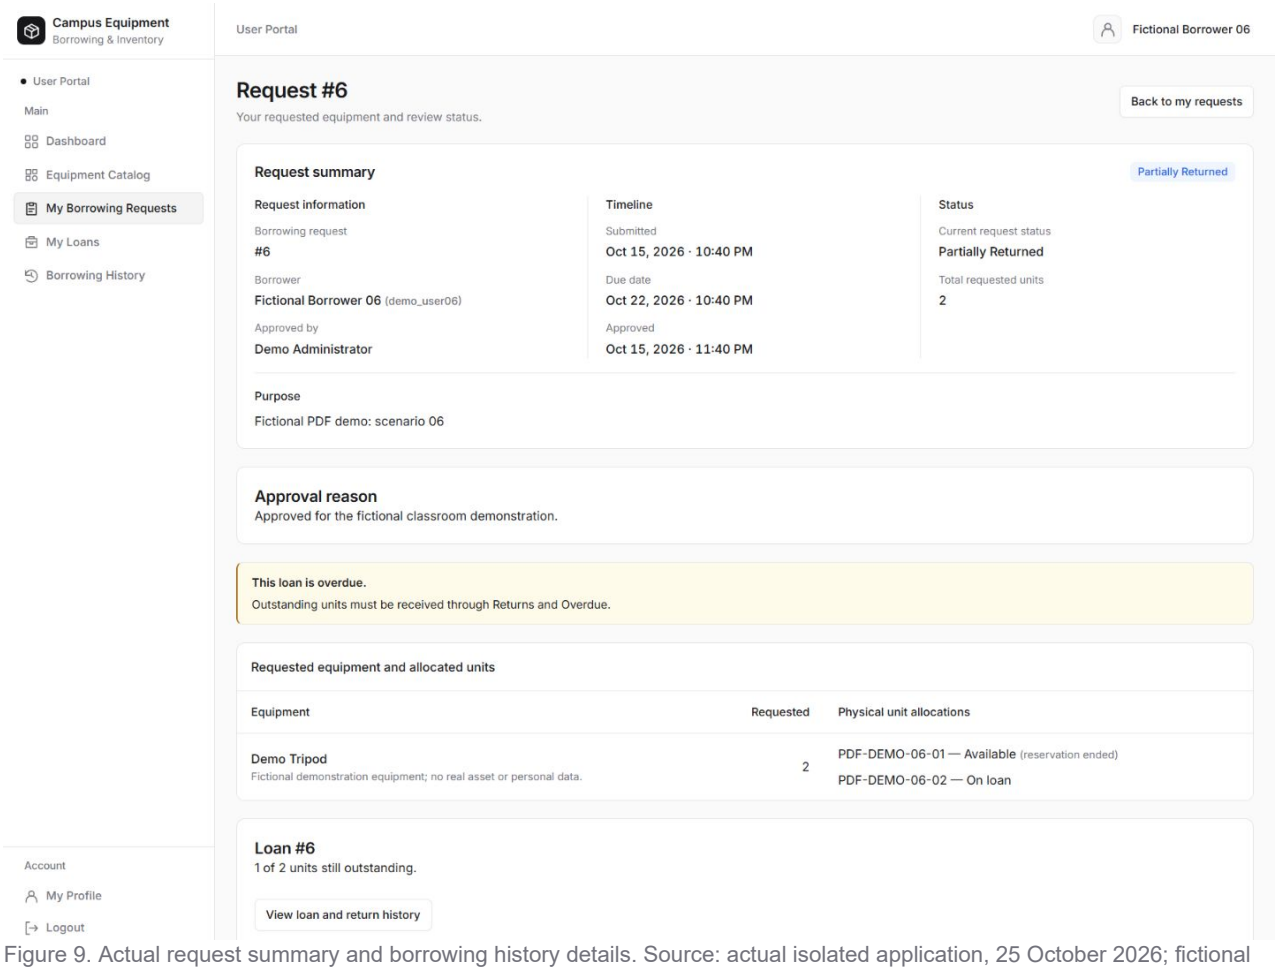

Figure 9. Actual request summary and borrowing history details. Source: actual isolated application, 25 October 2026; fictional records.

3.8 View loans and check due dates

Navigation: Main > My Loans

See the equipment you still hold and its current return status.

1. Open My Loans and use the available search/status/date filters.

2. Compare Due date, Outstanding and the textual status label.

3. Open a loan record for per-unit release/return details. Arrange physical return with Admin personnel; the Basic User portal does not record receipt.

Expected result: Outstanding loans remain visible; completed loans are available in your history.

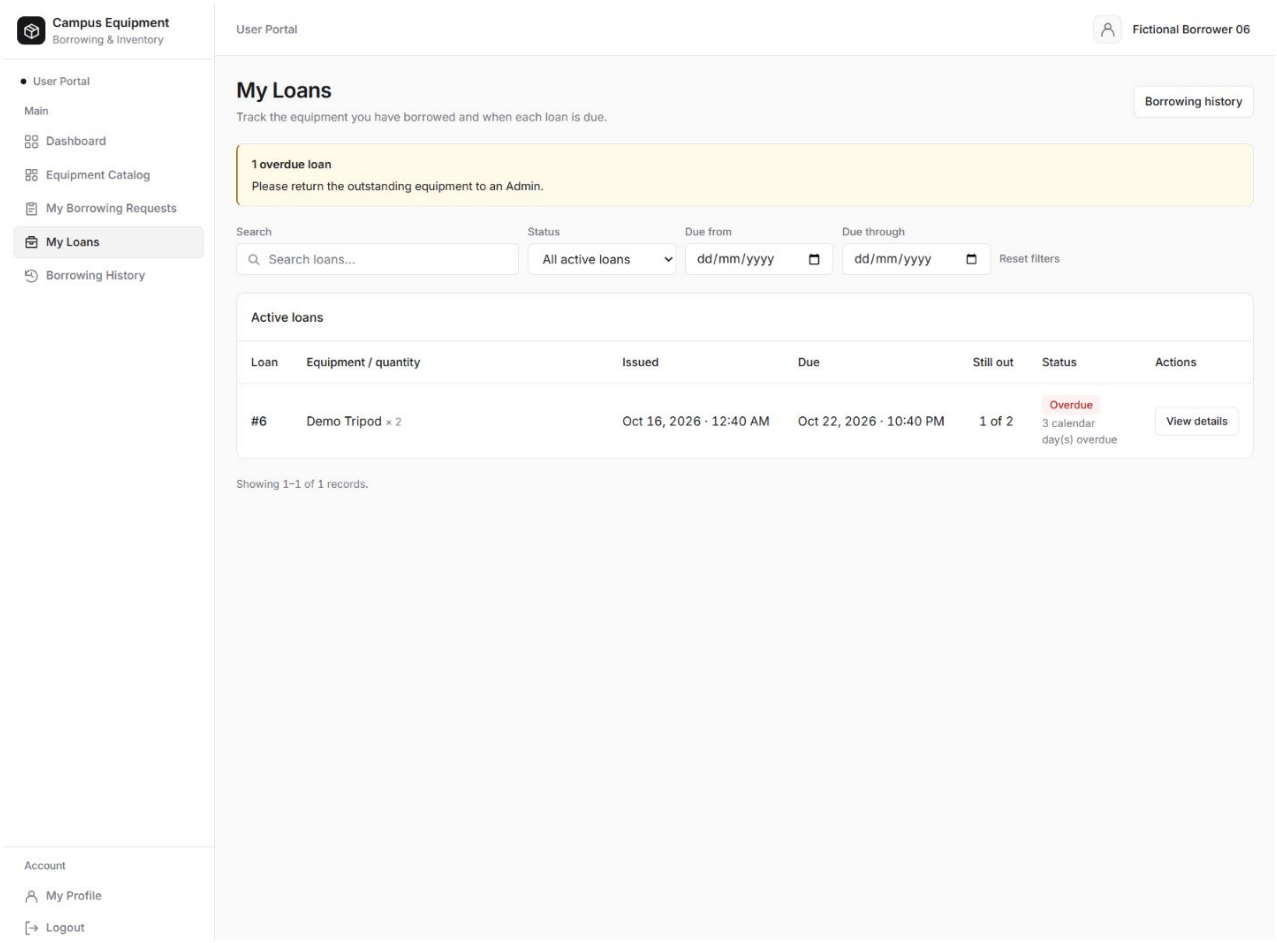

Figure 10. Owned loan list with due date and outstanding-unit totals. Source: actual isolated application, 25 October 2026; fictional records.

3.9 Read Loan Summary and return history

Navigation: My Loans > loan record

Use the compact summary and unit history to confirm what remains outstanding.

1. Read borrowing request, borrower, issuing Admin, issue/due/completion dates and outstanding count.

2. Read Purpose and equipment/return records below the summary.

3. If a unit has been physically returned but still appears outstanding, contact Admin with the request/loan number rather than submitting a forged return.

Expected result: The page shows a consistent loan summary and your recorded per-unit history.

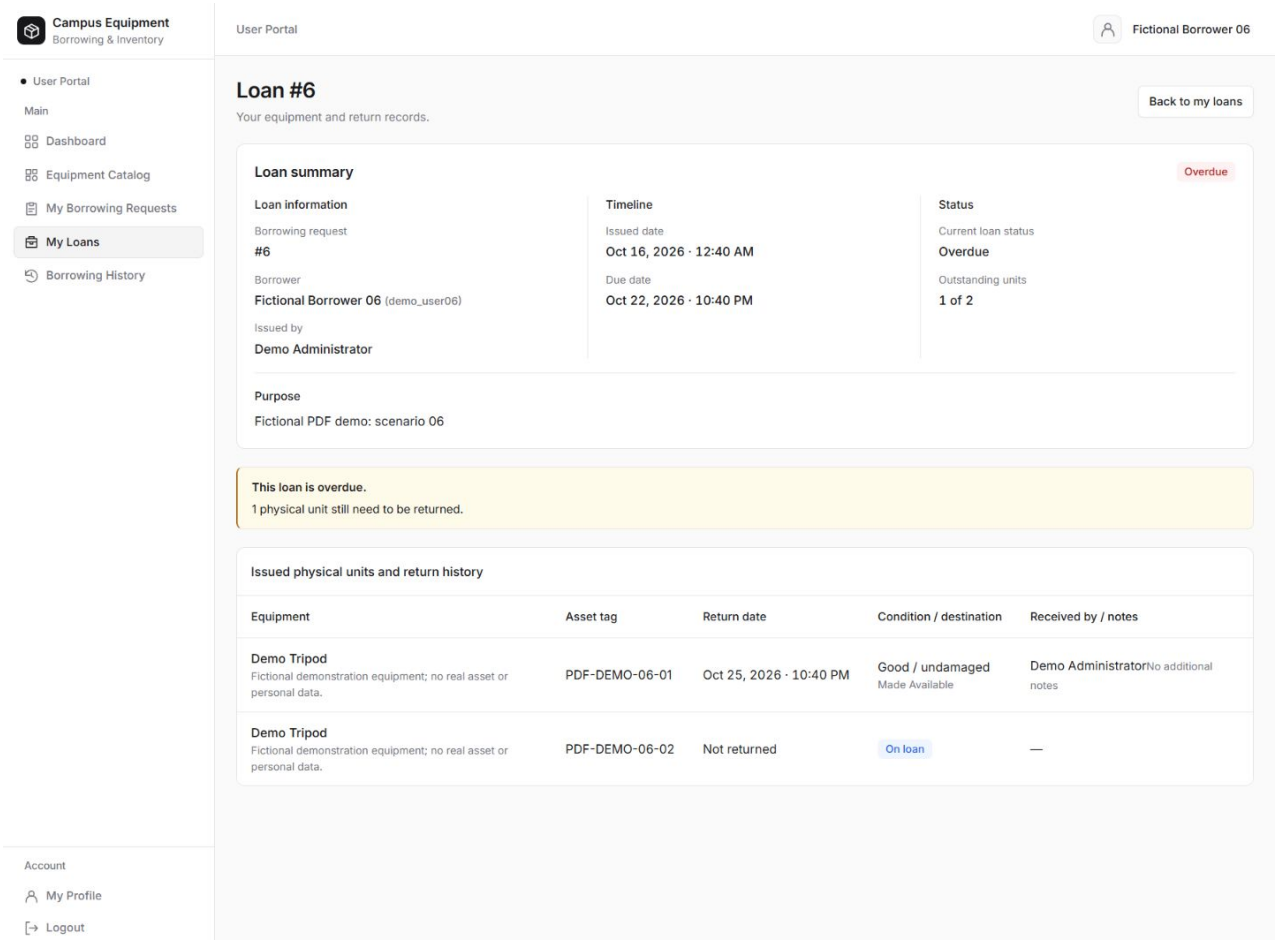

Figure 11. Loan summary with an outstanding partial overdue loan. Source: actual isolated application, 25 October 2026; fictional records.

3.10 View borrowing history

Navigation: Main > Borrowing History

Review completed loans retained for your account.

1. Open Borrowing History.

2. Search/filter using the provided controls and navigate pages as needed.

3. Open a returned loan to read its completion and per-unit history. If no completed loan matches, read the empty state and clear filters.

Expected result: Only your own completed history is displayed.

This account has no matching completed loan in the screenshot. The empty state is intentional; the automated owner-history test uses separate populated fixtures.

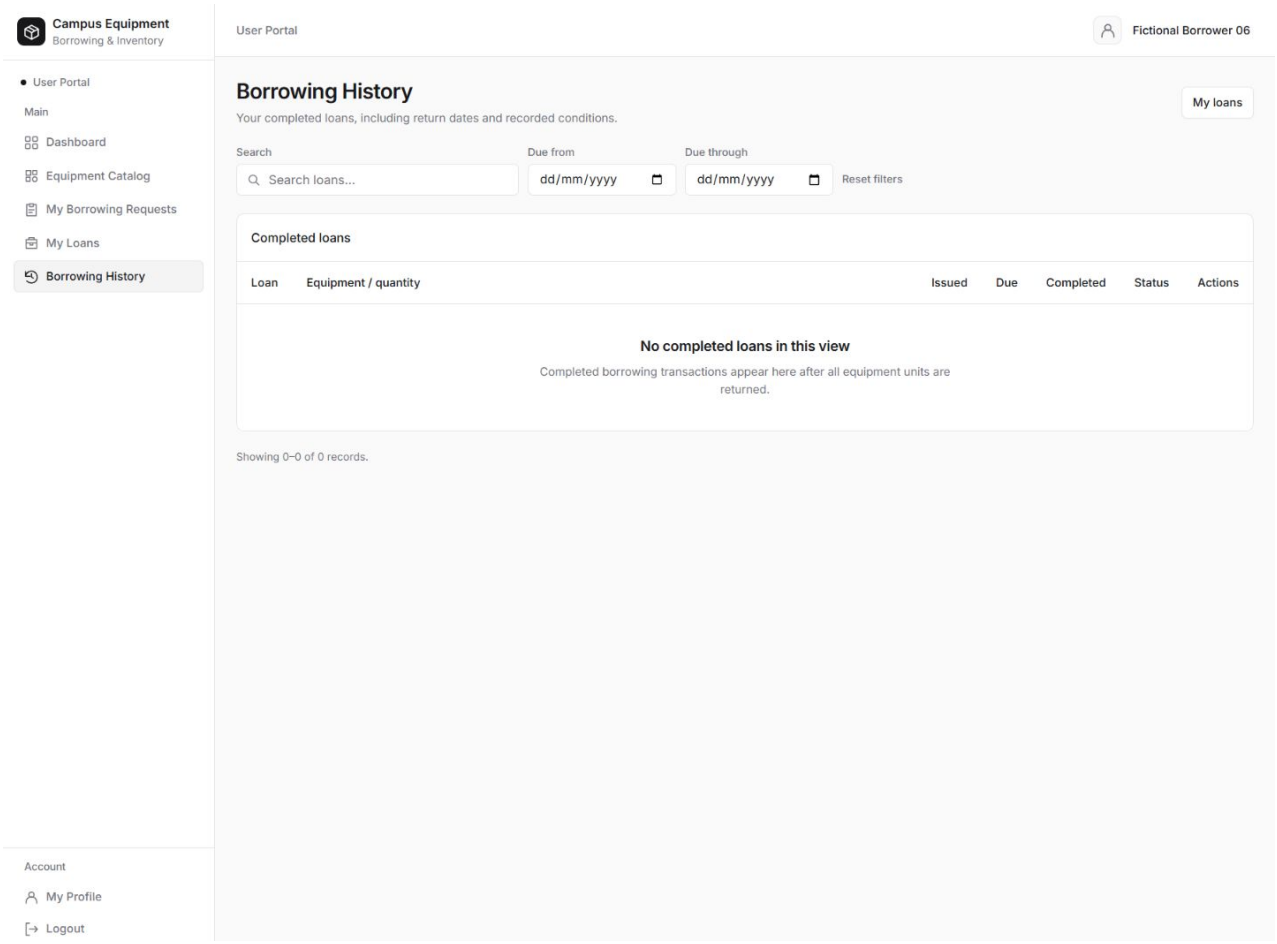

Figure 12. Actual empty completed-history view for the screenshot account. Source: actual isolated application, 25 October 2026; fictional records.

3.11 Update personal profile

Navigation: Account > My Profile

Keep your name, email and optional contact information current.

1. Open My Profile and review the account information.

2. Edit First name, Last name, Email and Contact number, then use the displayed save action.

3. Correct field errors if shown. If using Change password, enter the current password and a compliant matching new password privately.

Expected result: Permitted personal changes are saved. Role, account activation and another user's profile cannot be changed here.

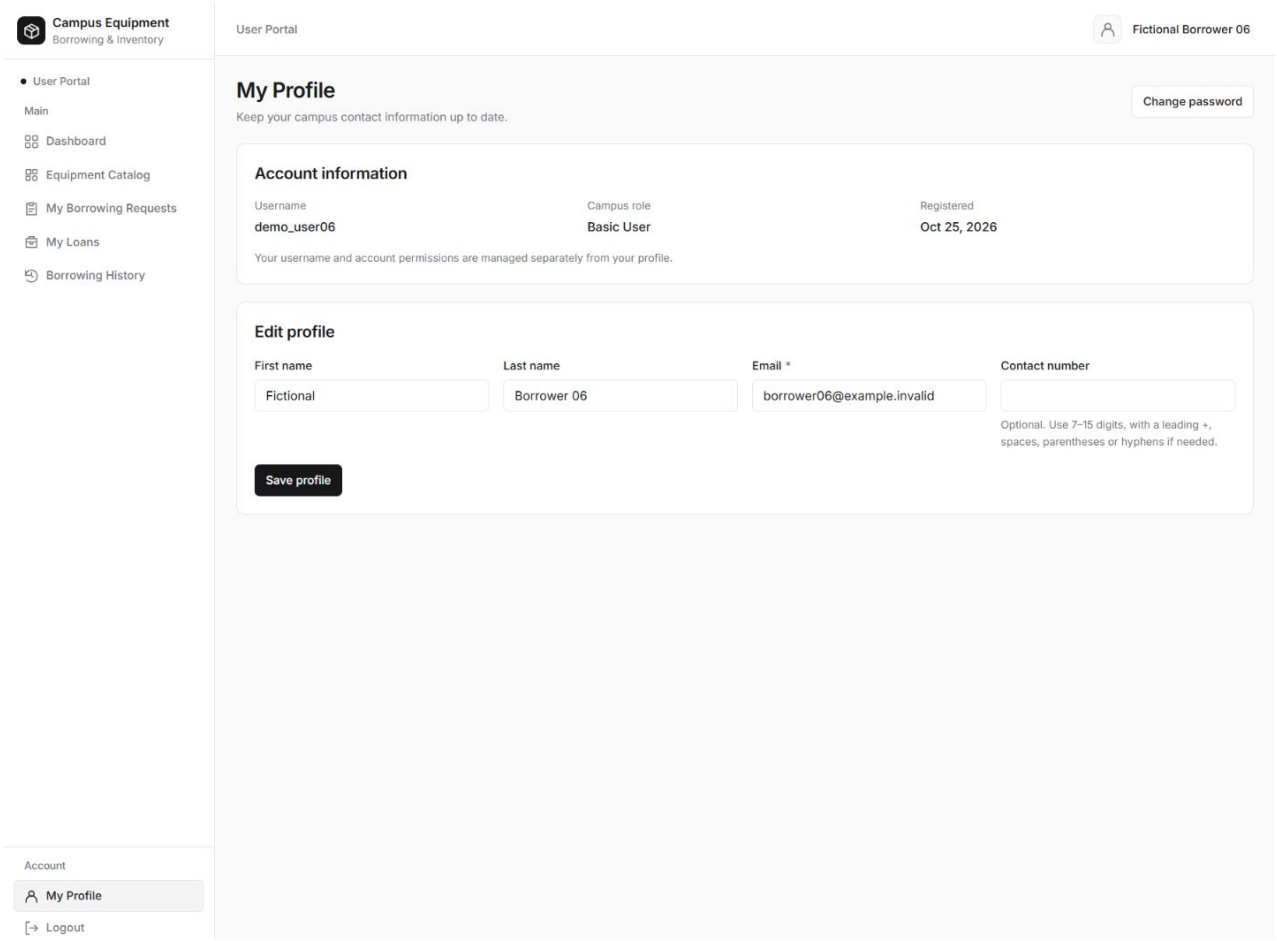

Figure 13. Basic User personal profile form. Source: actual isolated application, 25 October 2026; fictional records.

4. Administrator portal

4.1 Review dashboard and charts

Navigation: Overview > Dashboard > /manage/

Monitor borrowable inventory, Pending demand, active loans and outstanding overdue loans.

1. Sign in with the campus ADMIN role and open Dashboard.

2. Read Available units, Pending requests, Active loans and Overdue loans.

3. Review Monthly issued loans and Equipment-category usage within the chosen date period.

4. Use a relevant navigation item to review the underlying records rather than editing totals directly.

Expected result: KPIs and charts reflect current ORM records and the selected period.

Available units excludes archived/unavailable stock. Monthly issued loans counts Loan records, not request items or physical units. Returned unit issuances remain historical category usage. Exact date-range controls may vary with the selected dashboard view.

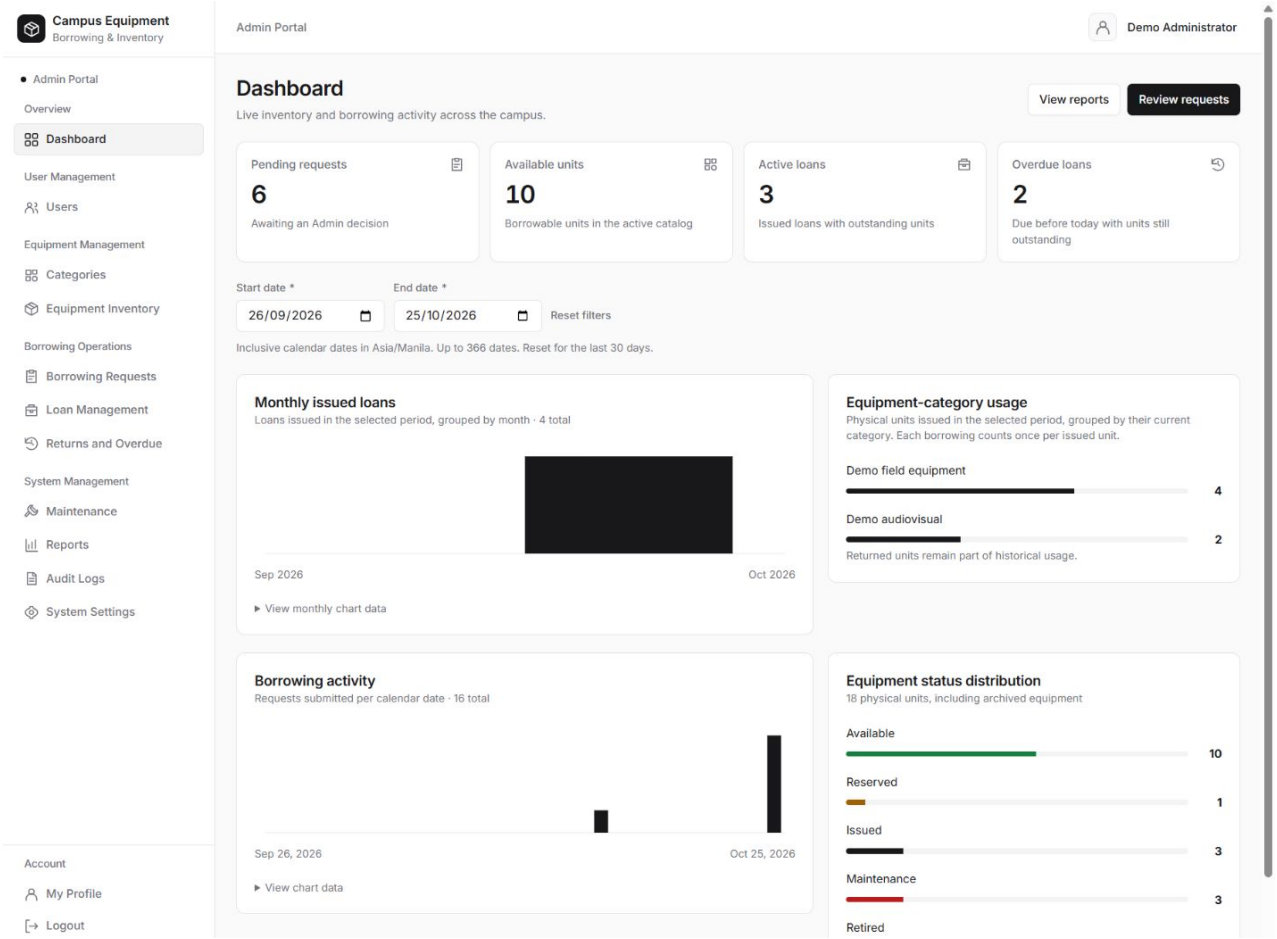

Figure 14. Admin KPI cards and live charts. Source: actual isolated application, 25 October 2026; fictional records.

4.2 Search users, inspect history and control accounts

Navigation: User Management > Users

Manage active access while retaining borrowing records.

1. Search by username, name or email; combine Role and Status filters.

2. Choose View user to inspect that account and its scoped request/loan history.

3. For an authorized account change, use the displayed activation/deactivation or role action, read its confirmation and submit once.

4. Verify feedback and audit history. Do not deactivate the last active Admin or treat framework staff flags as campus privileges.

Expected result: Validated account changes are attributable; deactivated users cannot sign in or continue protected transactions.

Role changes require explicit Admin authorization and confirmation. Public registration never offers Admin. Avoid changing account privileges as an ordinary demonstration shortcut.

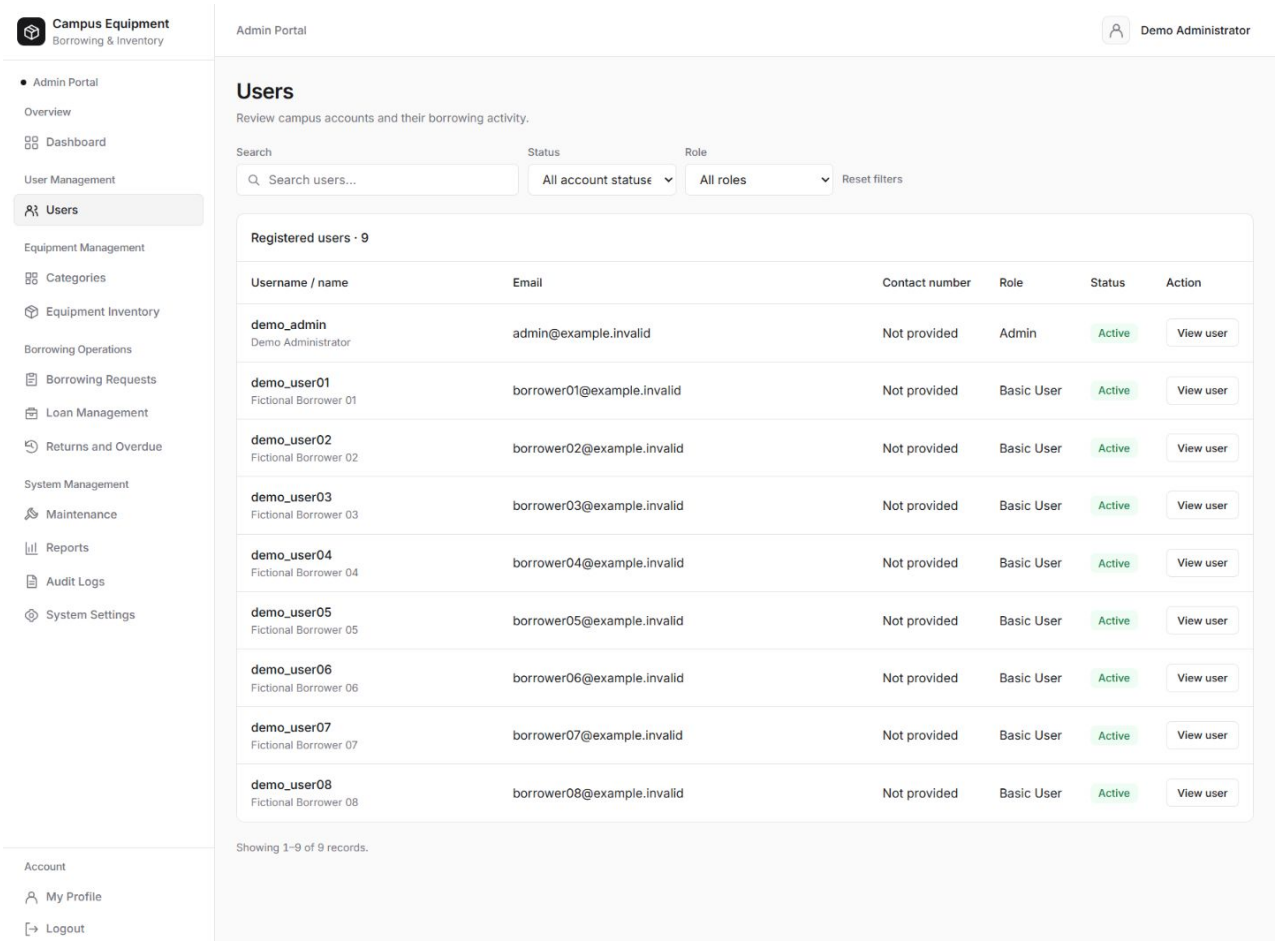

Figure 15. Admin account search, role/status filters and user actions. Source: actual isolated application, 25 October 2026; fictional records.

4.3 Create, edit, archive and restore categories

Navigation: Equipment Management > Categories

Organize equipment while retaining referenced masters.

1. Choose Create category, enter Name and optional Description, then save in the shared dialog. Use Edit on an existing row for corrections.

2. Use Archive or Restore on the category row and confirm the action. Read its Active/Archived label afterward.

3. Keep existing equipment relationships. An archived category cannot be newly assigned to new/different equipment, but existing items may retain it.

4. Use Review deletion only for an unreferenced category if genuinely appropriate. Referenced categories show deletion protection; archiving is the usual history-preserving action.

Expected result: Category changes preserve history and duplicate names remain rejected, including archived names.

Create/Edit links also have functional full-page fallbacks. Dialog validation keeps errors visible; Cancel closes without saving. A dirty dialog can ask for confirmation before discarding changes.

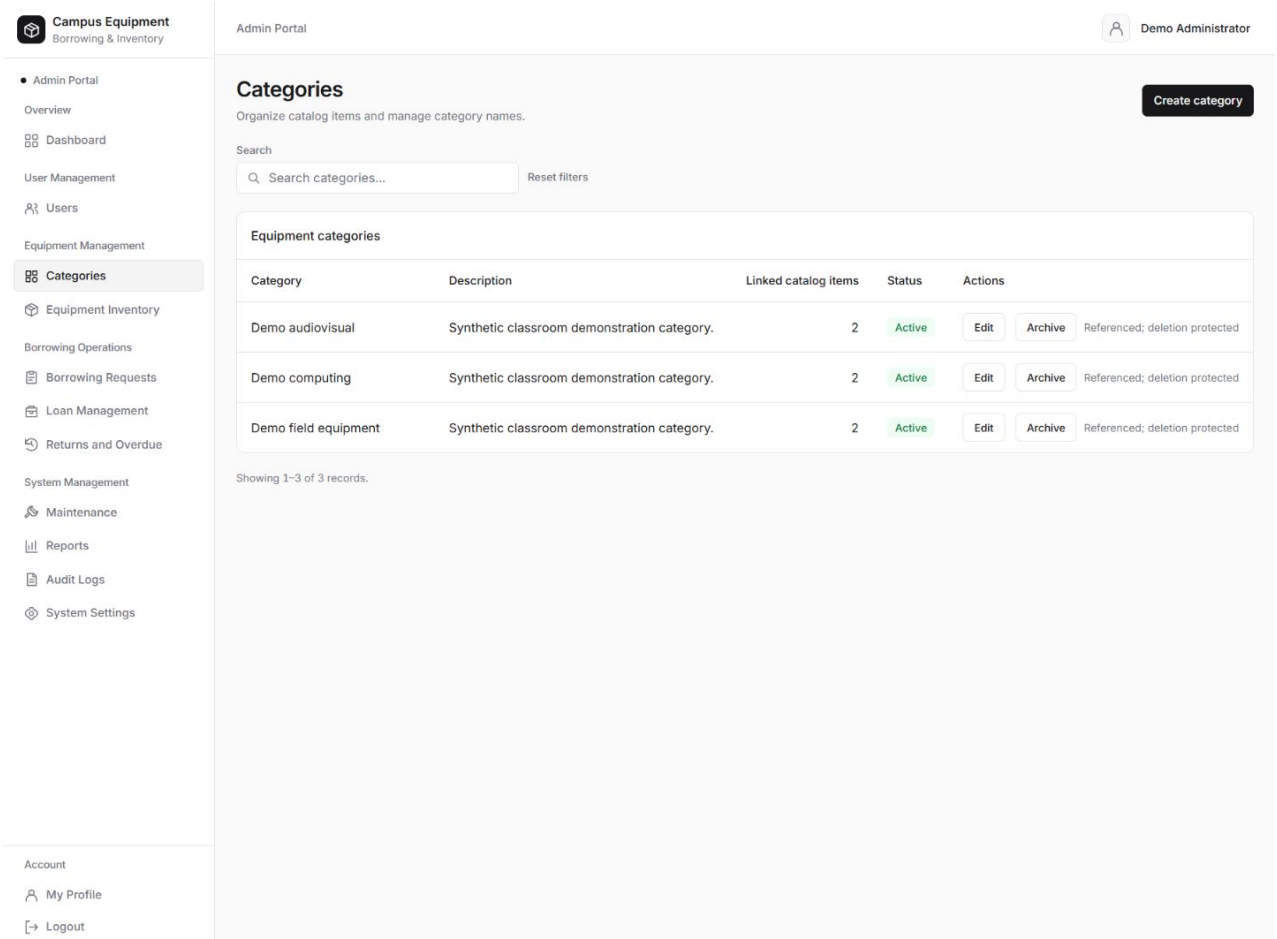

Figure 16. Category list, active states and shared quick actions. Source: actual isolated application, 25 October 2026; fictional records.

4.4 Manage equipment catalog items

Navigation: Equipment Management > Equipment Inventory

Maintain catalog metadata and inspect stock derived from physical units.

1. Choose Create catalog item. Enter Name, a valid Category and Public catalog description, then Save changes.

2. Use Manage on an item to open its management page. Use Edit catalog item for metadata corrections.

3. Review Total, Available, Reserved, Issued, Maintenance and Retired counts. Add physical records to change stock; never type a replacement aggregate total.

4. Use Review archive or Review restoration for eligible items and confirm. Reserved/Issued relationships must be resolved before catalog archiving.

Expected result: Catalog metadata/active state changes without deleting physical units or historical borrowing records.

Archived catalog items are hidden from Basic Users. Archiving a category alone does not implicitly hide each active item under it.

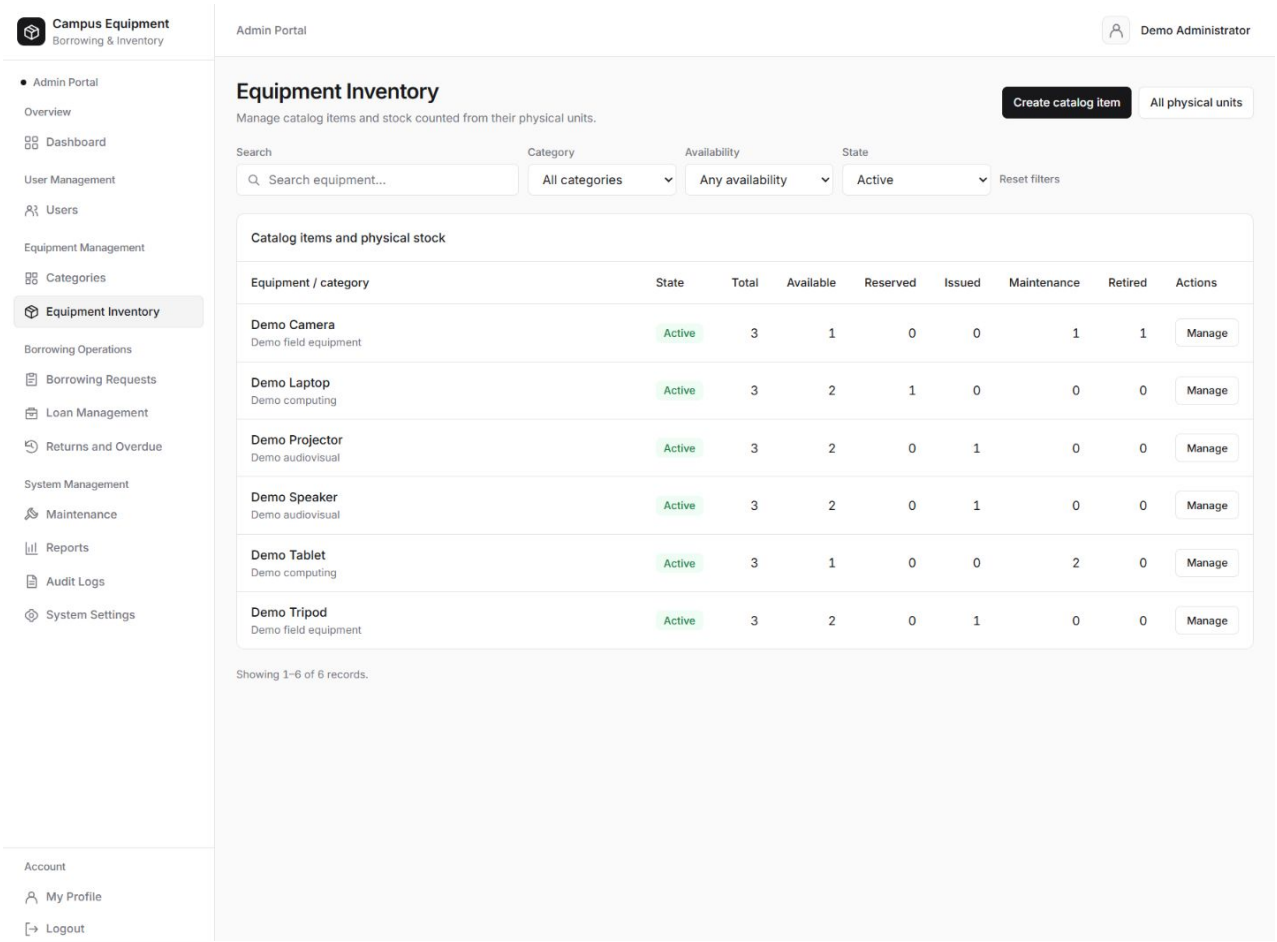

Figure 17. Equipment Inventory with catalog status and derived five-state counts. Source: actual isolated application, 25 October 2026; fictional records.

4.5 Register and filter physical units

Navigation: Equipment Inventory > All physical units; or Manage > Add physical unit

Track each physical asset, not only a catalog quantity.

1. Open Manage for the target catalog item and choose Add physical unit.

2. Enter a unique Physical unit identifier and the known Condition and Acquisition date. Save unit. New units start Available; do not fabricate unknown historical acquisition dates.

3. Open All physical units and combine Category, Equipment, Status and Search filters. Use Reset filters and pagination as needed.

4. Use Edit unit only when shown. Correct permitted identifier/condition/date values; use Maintenance history to inspect repair records or Review retirement for an eligible idle unit.

Expected result: Each unit retains a unique normalized identifier and independent condition/status. Filters return only matching units.

Identifiers are trimmed and normalized to uppercase. Reserved, Issued or actively maintained units must finish their owning workflow before ordinary editing/retirement. A new transaction cannot be forced by changing a browser field.

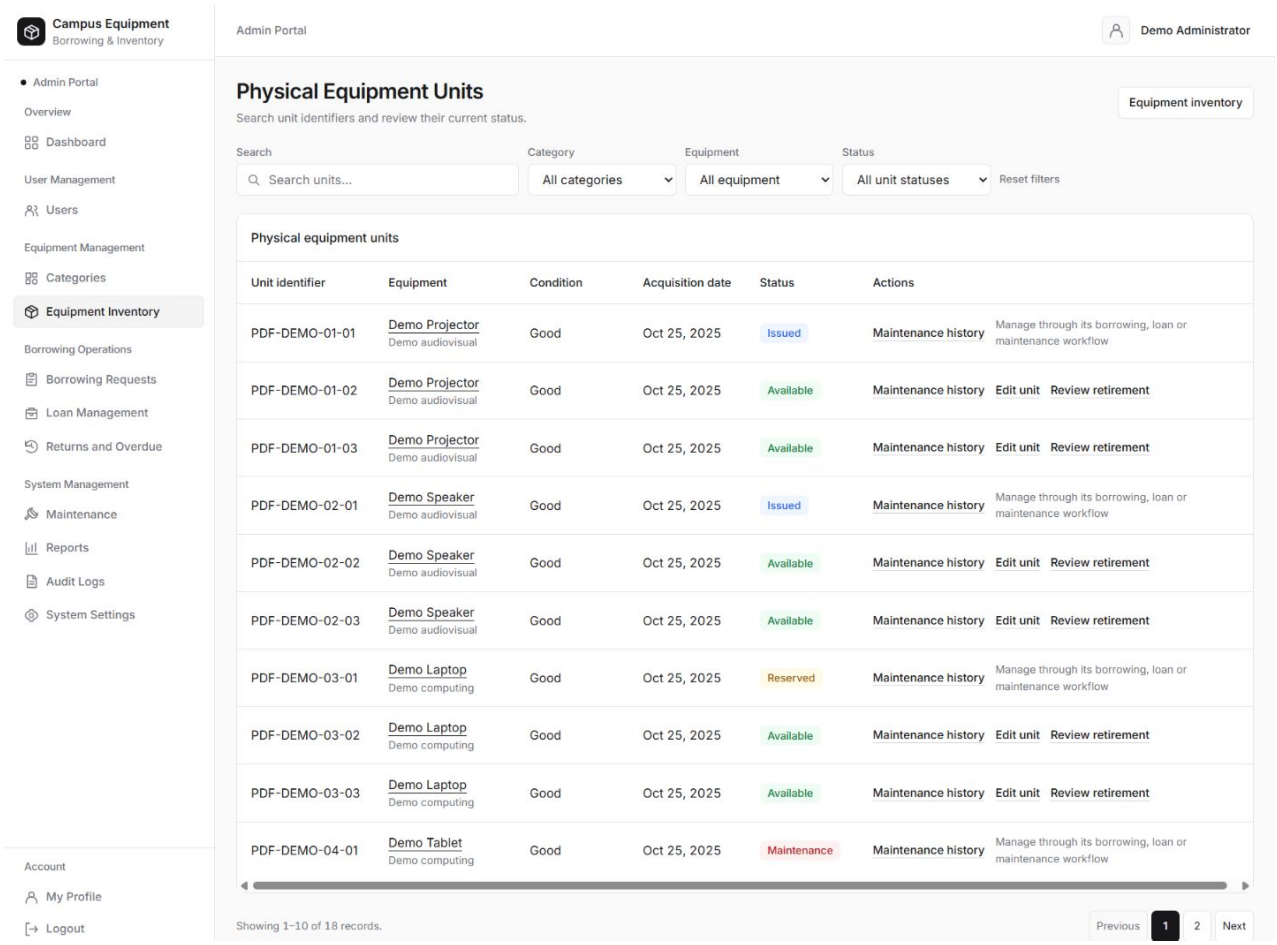

Figure 18. Physical-unit table with condition, acquisition and contextual actions. Source: actual isolated application, 25 October 2026; fictional records.

4.6 Review, approve or reject requests

Navigation: Borrowing Operations > Borrowing Requests

Make a decision against the current available inventory.

1. Use Search, Status and request date filters to locate the request; open its review record.

2. Read borrower, purpose, requested quantities, agreed/desired due date and current inventory.

3. For Pending requests choose Approve request or Reject request. Enter the required decision reason and confirm the decision.

4. On approval, inspect the exact reserved-unit allocation. If inventory changed or one item lacks stock, approval fails as a whole; reload before retrying.

Expected result: Approval reserves exact eligible units atomically; rejection records a reason and reserves none.

The standard approval action selects eligible physical units automatically. This guide does not claim a manual asset-selection control. Pending requests can compete for stock without reserving it.

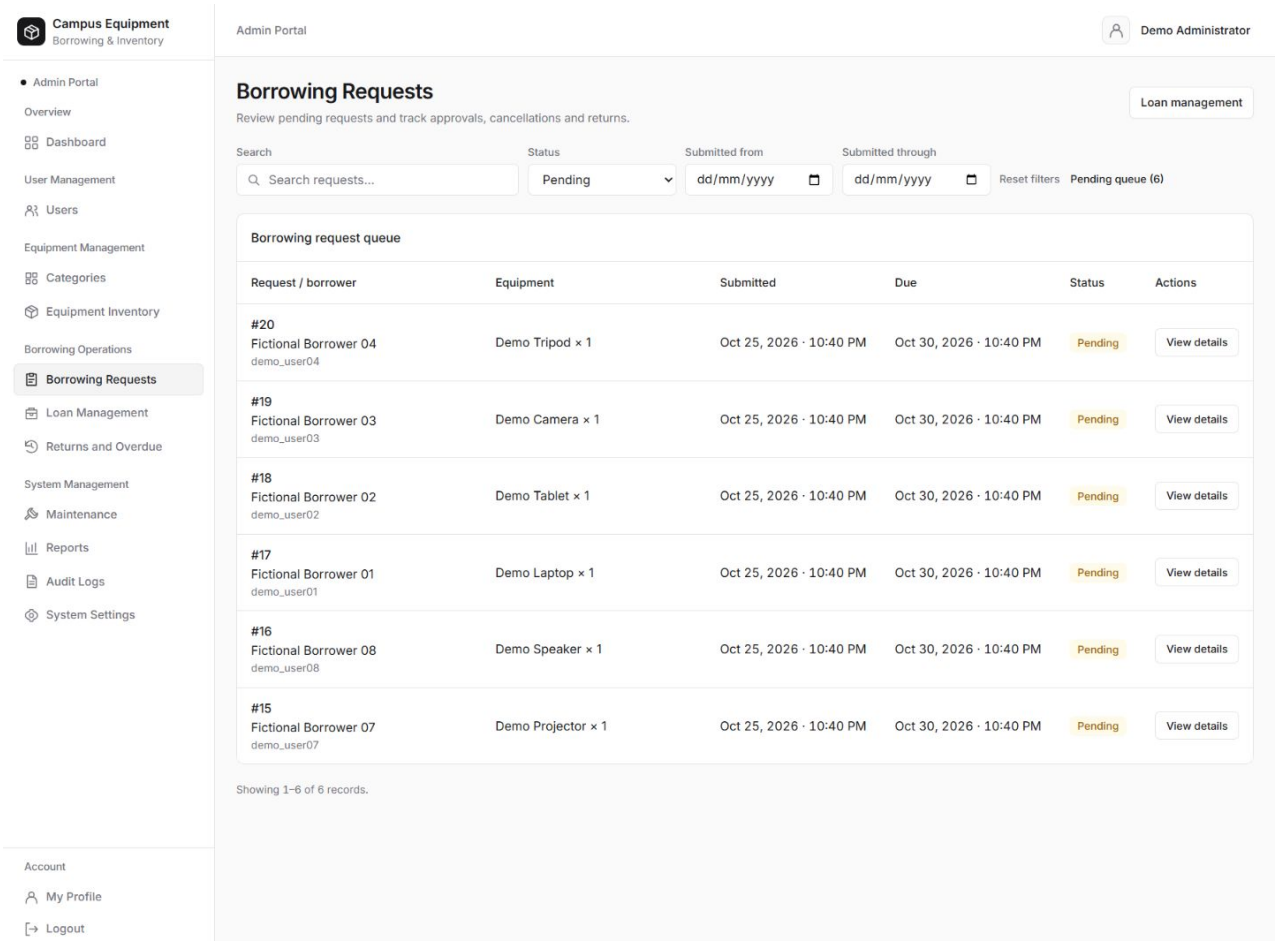

Figure 19. Searchable paginated request queue and status/date filtering. Source: actual isolated application, 25 October 2026; fictional records.

4.7 Revise an Approved due date before issuance

1. Open the Approved request review and choose Revise due date.

2. Enter a future date permitted by the current policy measured from the original submission; provide a specific reason.

3. Submit the dialog once. If a stale/conflict or policy error appears, reload and reassess rather than bypassing it.

4. Verify the revised date and audit event before reviewing equipment release.

Expected result: old/new date, Admin, time and reason are recorded; issue copies the final approved date. A revision can recover an expired approval only if a valid future date still fits the original-submission policy window. Issued/Completed requests cannot be revised, and release of an expired date remains prohibited.

4.8 Review and confirm equipment release

Navigation: Loan Management > Review request; or Approved request > Review equipment release

Record actual handover only after checking the reserved asset identifiers.

1. Open the Approved request release review and confirm borrower, purpose, due date and each exact reserved asset tag.

2. Do not continue if the agreed date is expired or units/allocations are missing. Resolve the eligible date revision or conflicting workflow first.

3. Mark the handover confirmation and choose Release equipment. Review the confirmation dialog and confirm the listed assets.

4. Wait for the new loan record and verify issue Admin/time, final due date and outstanding units.

Expected result: One Loan is created; reserved units become Issued. Duplicate, rejected, cancelled or already-issued release is refused.

The screenshot is a review state only; no physical handover was performed in the screenshot session. Backend transaction tests verify successful and invalid releases.

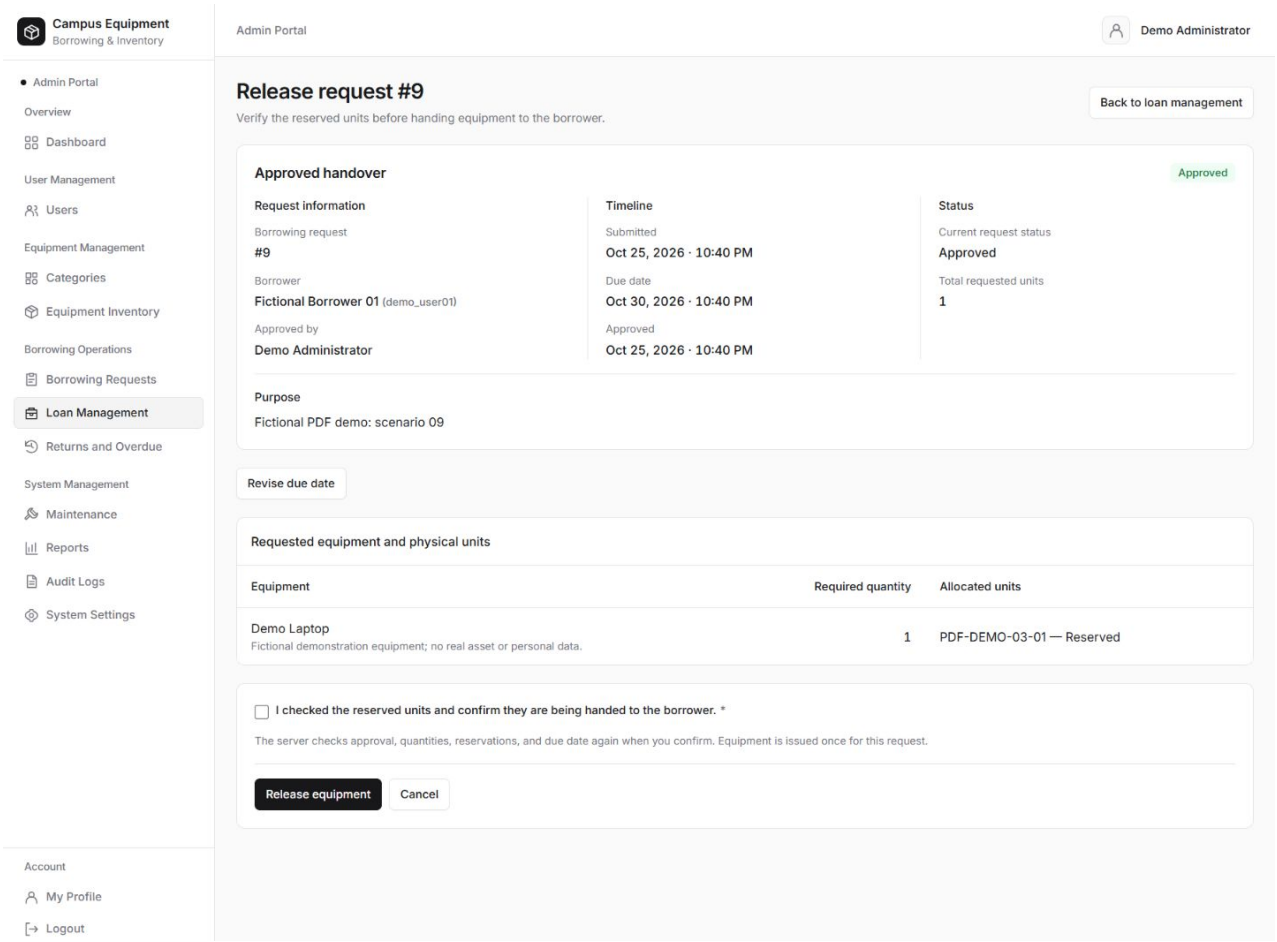

Figure 20. Actual release review for an Approved fictional request before handover. Source: actual isolated application, 25 October 2026; fictional records.

4.9 Read or print a borrowing slip

Navigation: Loan record > Printable borrowing slip

Prepare a handover reference with the borrower and actual asset codes.

1. Open the issued Admin loan record and choose Printable borrowing slip.

2. Check borrower, issue details, due date and every listed asset code.

3. Choose Print borrowing slip to open the browser printing workflow. Review the printer/page preview before printing or saving a local PDF.

Expected result: The printable web slip contains the loan/borrower and issued physical identifiers.

Web slip rendering and content were verified. Physical printer output and browser print-preview pagination were not exercised during this package run and remain a separate manual check.

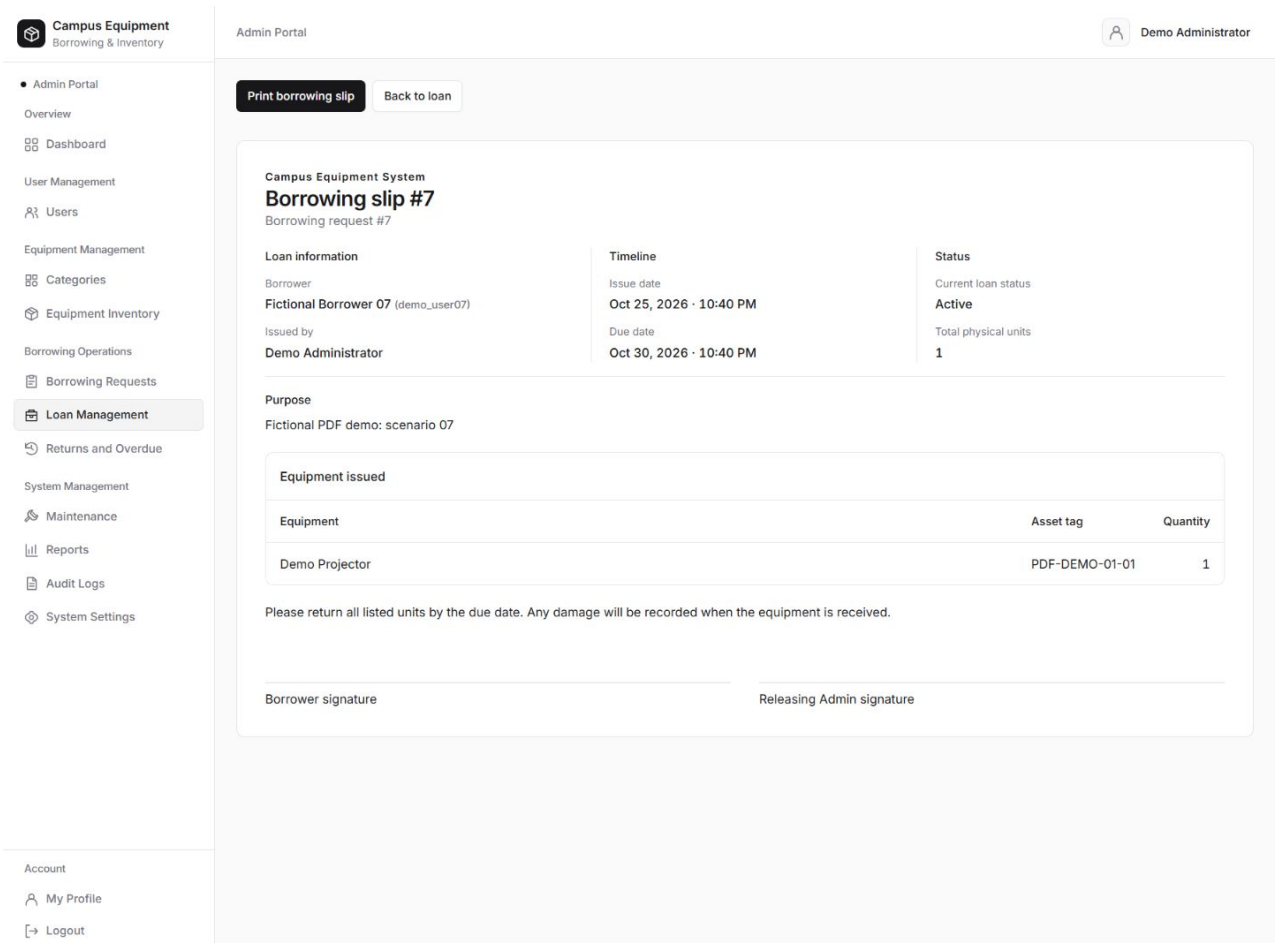

Figure 21. Actual printable web borrowing slip. Source: actual isolated application, 25 October 2026; fictional records.

4.10 Record partial or full equipment returns

Navigation: Returns and Overdue > loan record > Process returns

Receive only the physical units actually returned.

1. Open the loan and choose Process returns. Compare each outstanding item/asset tag with the physical equipment.

2. Select returned units and choose Good / undamaged or Damaged for each. Add required/appropriate notes, especially the damage description.

3. Read the confirmation, choose Save selected returns and confirm the selected list with Confirm returns.

4. Verify per-unit receipt dates/conditions and outstanding count. Leave absent units unselected for a partial return; the final return completes the loan and request.

Expected result: Good returns become Available; damaged returns enter Maintenance atomically. Duplicate/cross-loan returns are rejected.

The server records actual return time and receiving Admin. Do not mark unreturned equipment as received just to close an overdue record.

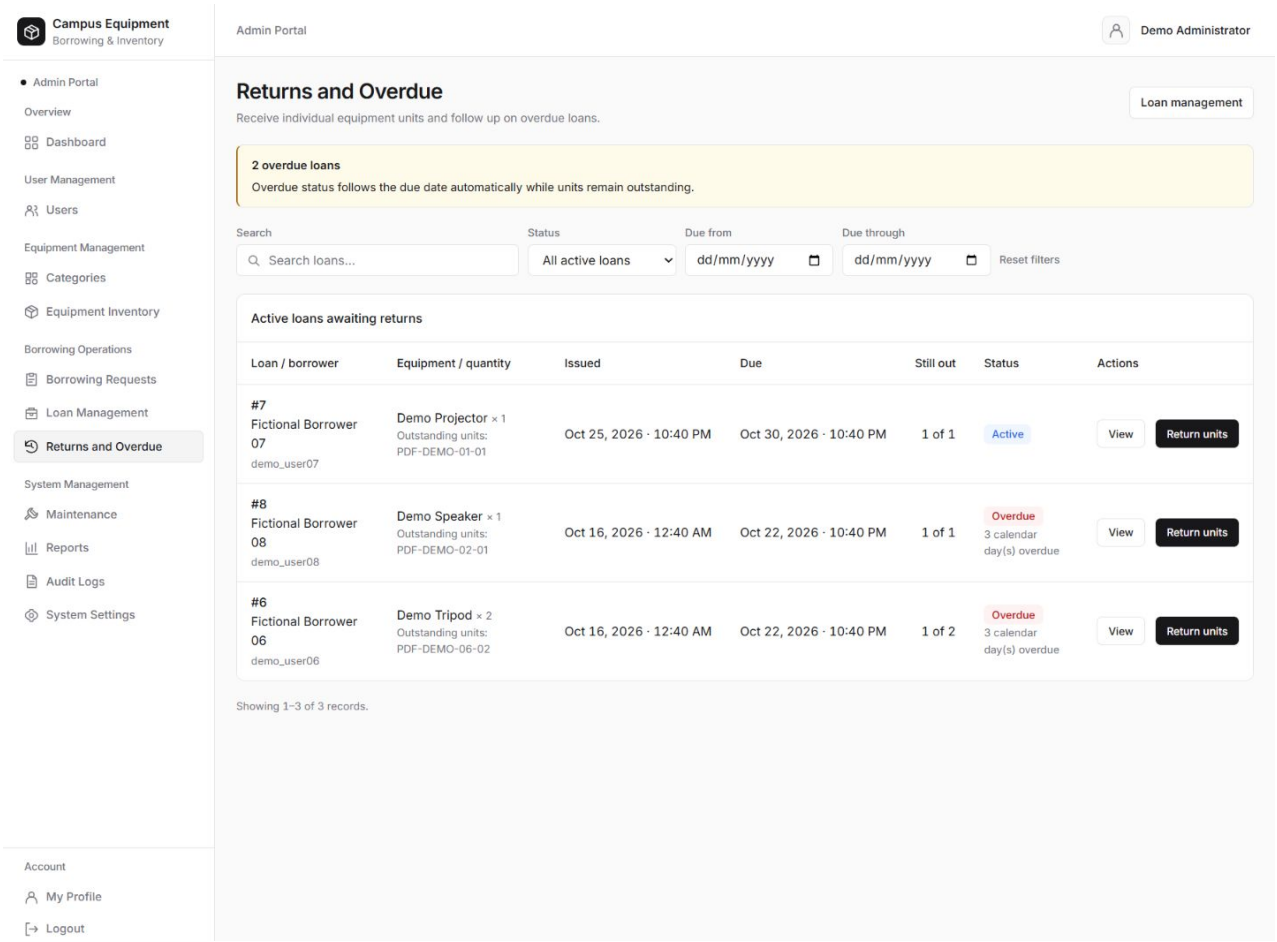

Figure 22. Active return queue and outstanding overdue loans. Source: actual isolated application, 25 October 2026; fictional records.

4.11 Interpret overdue monitoring

A loan is overdue only when at least one unit remains outstanding and today is after its Asia/Manila due calendar date. The same due date gives zero overdue days, even after the displayed due time. The following local date counts as one overdue day. Reports, dashboard, My Loans and CSV use the same rule. Completing the last return removes overdue status. The system records no fine, penalty or payment.

4.12 Report, start and complete maintenance

Navigation: System Management > Maintenance

Keep inventory unavailable during repair and preserve accountable maintenance history.

1. Use the new-report action to select an eligible physical unit and describe Reported issue. Save the report; it starts Reported and its unit is Maintenance.

2. For a Reported row choose Start repair and confirm. The record becomes In progress while the physical unit remains Maintenance.

3. For In progress choose Complete repair. Enter Repair action taken, choose Repaired / serviceable or Retired / unserviceable, confirm and save.

4. Check the completion date/Admin and inventory outcome. Repaired becomes Available; Retired stays unavailable. Closed rows use View record. Use permitted update actions for progress notes, not to reverse closed history.

Expected result: Transitions and action notes remain auditable; invalid reverse/duplicate transitions fail server validation.

Reserved/Issued units cannot receive manual maintenance reports. Return issued damaged equipment through the return workflow first. Physical condition and inventory status are distinct; a serviceability decision must reflect the real repair checks.

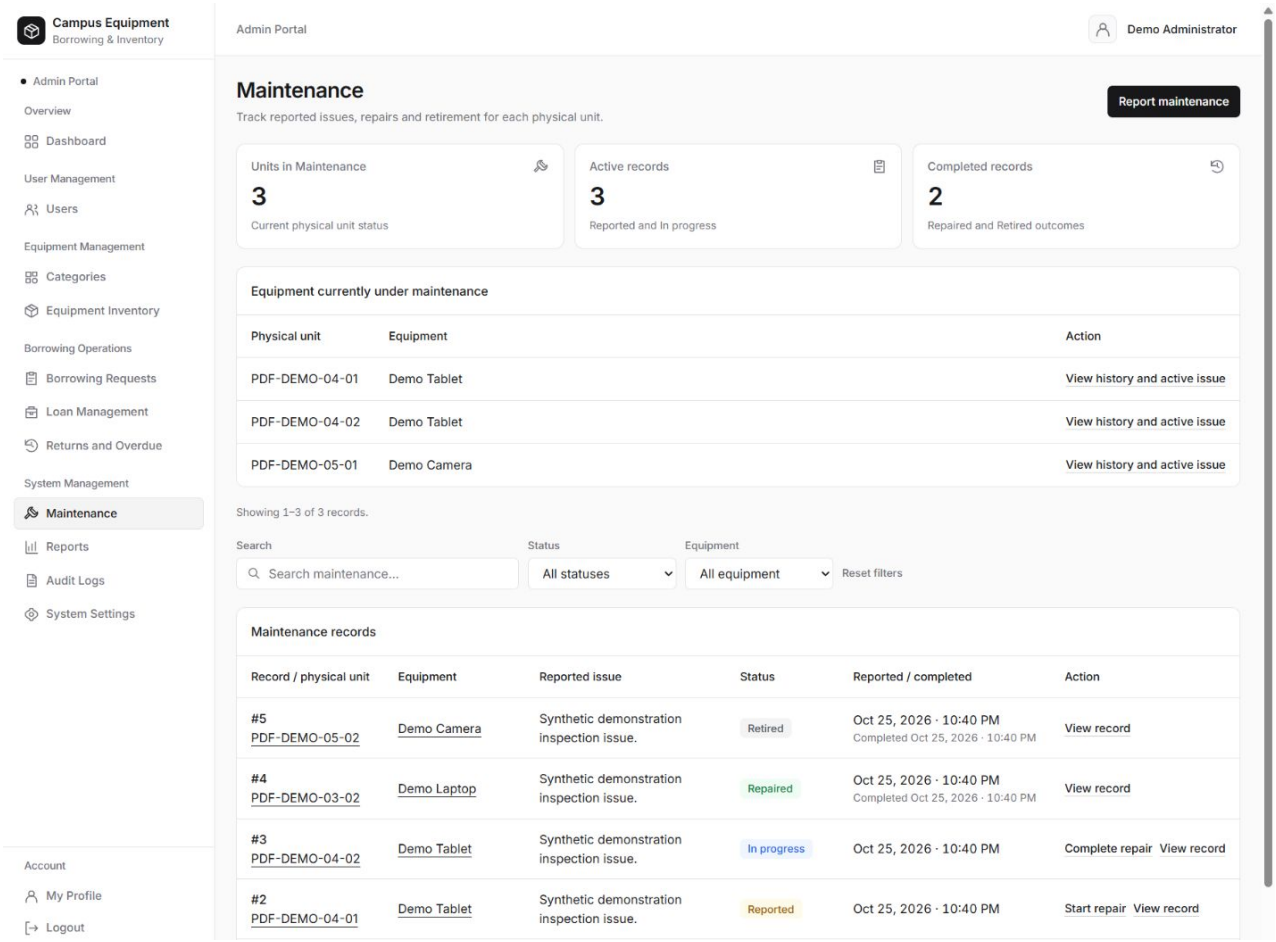

Figure 23. Maintenance list with contextual Start repair, Complete repair and View record actions. Source: actual isolated application, 25 October 2026; fictional records.

4.13 Read reports and export CSV

Navigation: System Management > Reports

Generate date-filtered loan or overdue evidence from current related records.

1. Choose the report type and enter the applicable From/To date range and other available filters.

2. Read borrower, equipment/physical units, issue/due dates, outstanding/returned status and overdue duration.

3. Use the CSV export action to download every filtered row, including rows beyond the current displayed page.

4. Verify the chosen period before sharing. Treat downloaded borrower reports as restricted information; use fictional data for public class evidence.

Expected result: HTML and CSV represent the same filtered population and computed status, using preserved issue snapshots.

Loan reports filter issue dates; overdue reports filter due dates. CSV quoting/formula defenses do not remove the obligation to handle exported personal records responsibly.

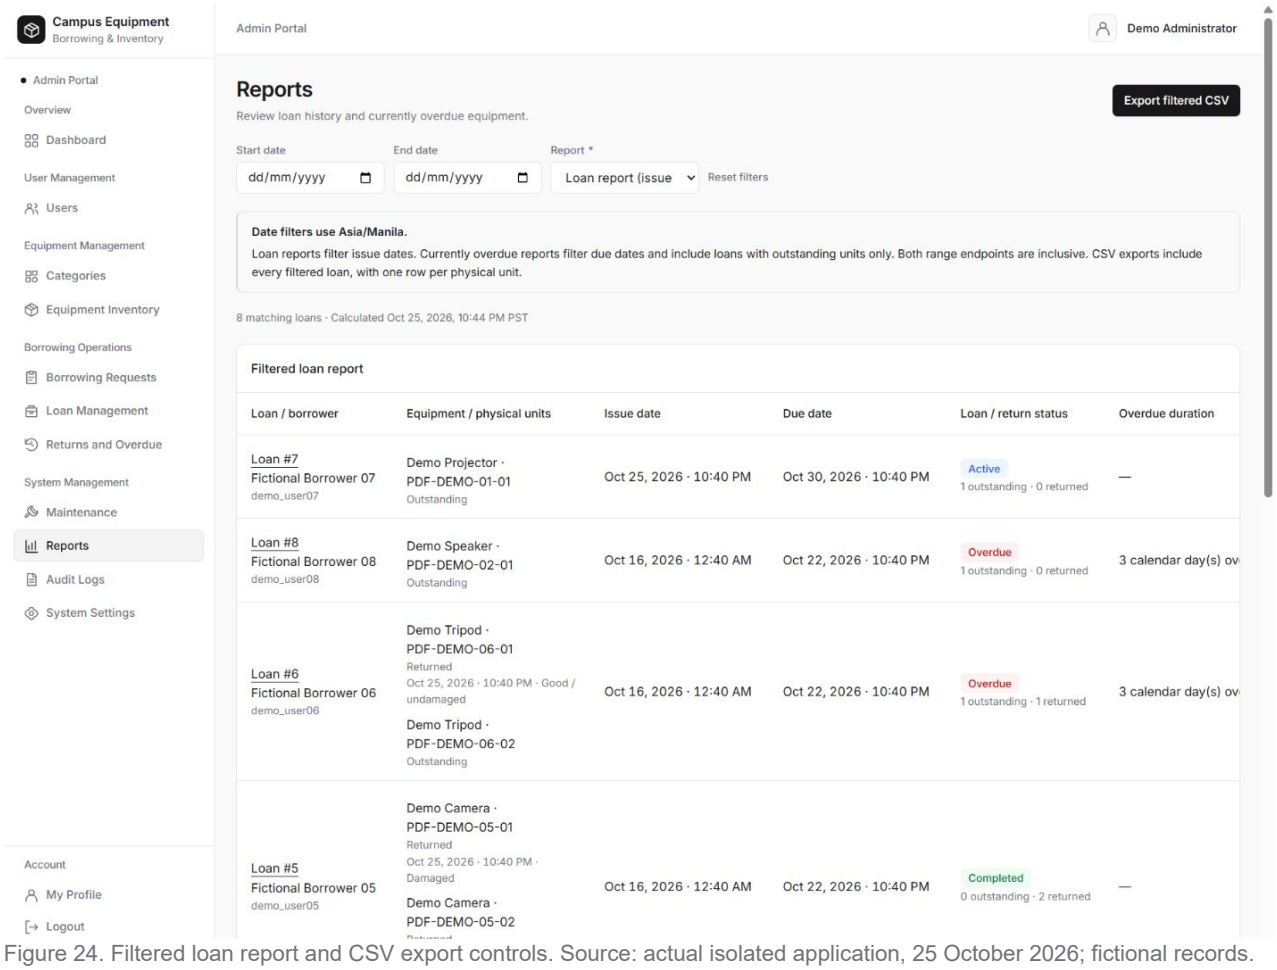

Figure 24. Filtered loan report and CSV export controls. Source: actual isolated application, 25 October 2026; fictional records.

4.14 Configure borrowing limits

Navigation: System Management > System Settings

Set validated policy for new submissions and Pending approvals without rewriting recorded agreements.

1. Read the current policy and explanatory notice.

2. Set Maximum distinct catalog items (1-3), Maximum units per catalog item (1-20) and Maximum borrowing duration (1-30 calendar days). Defaults are 3, 3 and 7.

3. Save once. Correct any field errors rather than trying to raise the hard item ceiling beyond three.

4. Review the recorded update and audit event; verify a new request obeys the policy.

Expected result: Valid settings apply to new requests; Approved/Issued recorded terms are retained.

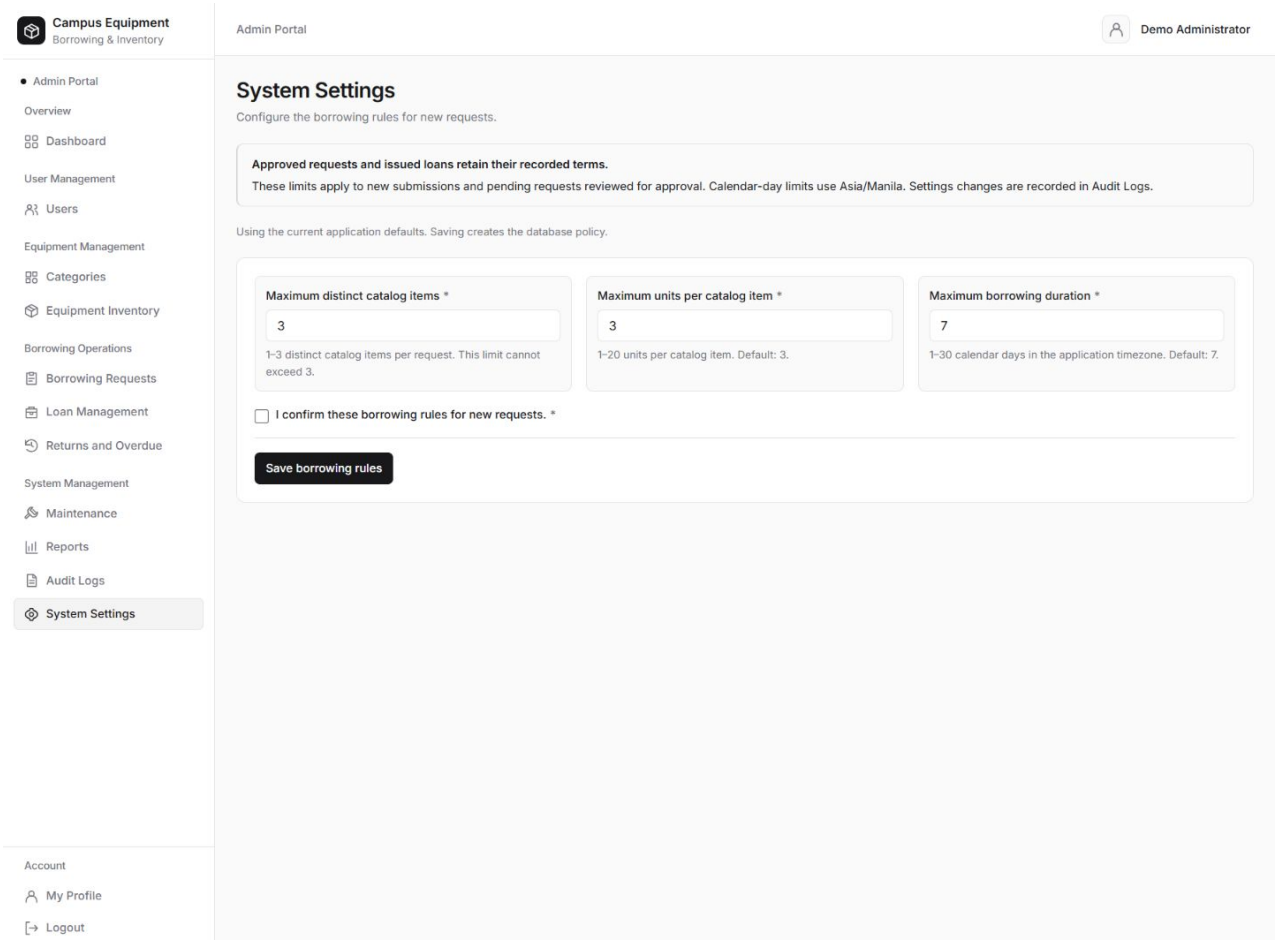

Figure 25. Current borrowing policy with validated numerical settings. Source: actual isolated application, 25 October 2026; fictional records.

4.15 Search audit history

Navigation: System Management > Audit Logs

Review accountable account, inventory and borrowing changes.

1. Search by actor, action, affected entity or record identifier and apply date filters.

2. Read Date / time, Actor, Action, Affected entity and Description.

3. Use pagination while retaining filters; correlate a request/loan/unit identifier with its detail record when investigating an issue.

Expected result: Authorized Admins can inspect attributable historical events; Basic Users cannot access internal audits.

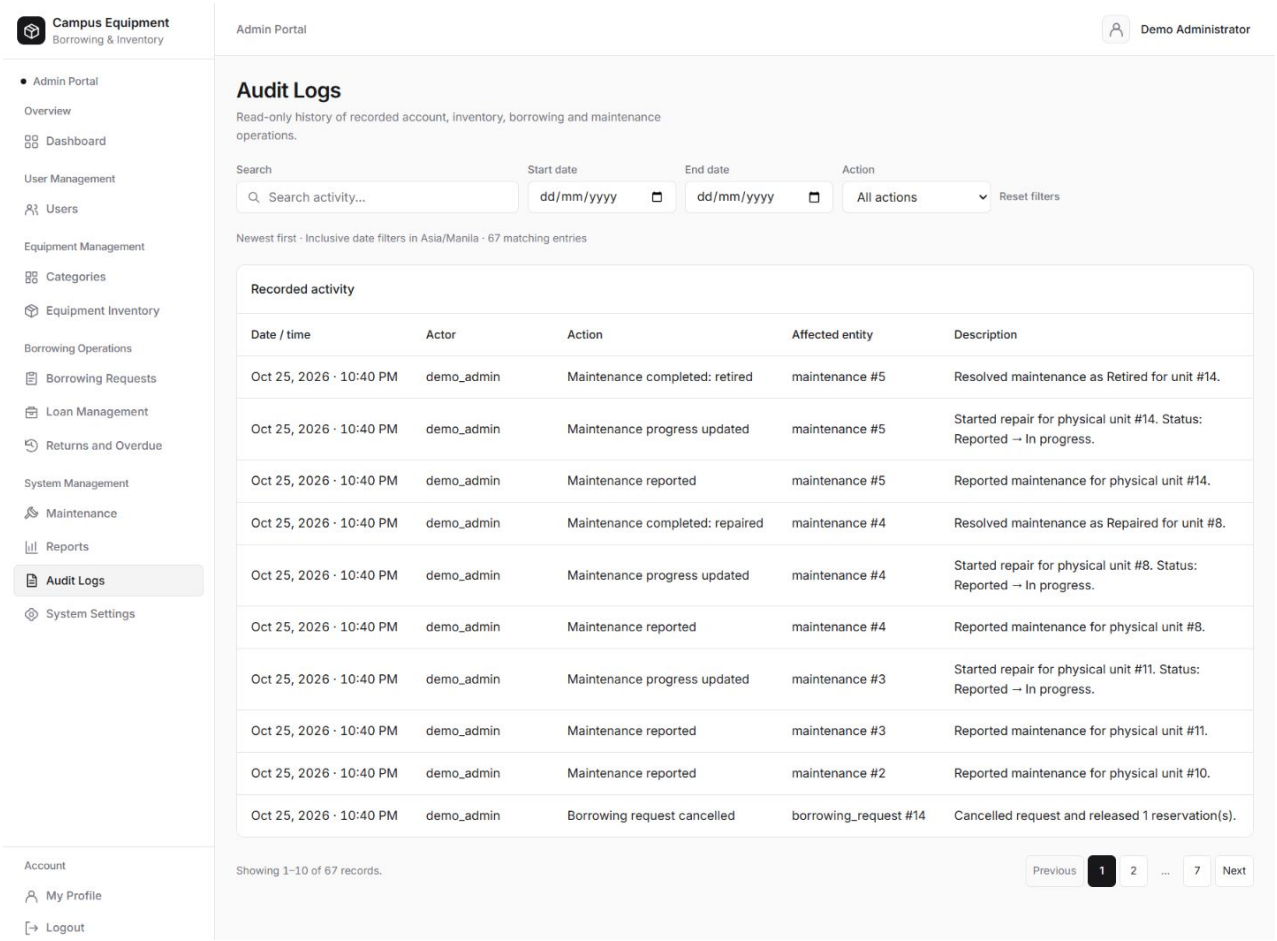

Figure 26. Actual searchable audit records with actor, action and timestamp. Source: actual isolated application, 25 October 2026; fictional records.

4.16 Admin personal profile and sign-out

Use Account > My Profile for permitted personal details and password controls, following Section 3.11. Profile editing does not change your campus role or another account. Use Logout, then Sign out in the confirmation dialog when finished; avoid leaving an Admin session open on a shared computer.

5. Status reference and complete workflows

5.1 Borrowing request labels

Label / stored value	Meaning	Permitted next action
Pending / PENDING	Submitted interest, no units reserved.	Admin approve/reject; owner/Admin eligible cancellation.
Approved / APPROVED	Exact physical units are reserved.	Review release; Admin valid due-date revision; eligible cancellation.
Rejected / REJECTED	Declined with recorded reason.	Read history; create a separate new valid request if appropriate.
Cancelled / CANCELLED	Stopped before issue; Approved reservations released.	Read retained record; cannot issue.
Issued / ISSUED	Loan created and units handed over.	Admin receives units; borrower tracks loan.
Partially Returned (derived)	Some issued units returned; at least one remains.	Return remaining units through Admin.
Returned / COMPLETED	All issued units received.	Read completed history; no further returns/cancellation.

5.2 Physical-unit and condition values

Inventory status	Meaning and availability
Available / AVAILABLE	Eligible idle stock, subject to active catalog and relationship checks.
Reserved / RESERVED	Allocated to Approved request; unavailable to another borrower.
Issued / ON_LOAN	Currently handed over; unavailable until valid return.
Maintenance / MAINTENANCE	Awaiting/under repair; unavailable.
Retired / RETIRED	Removed from service but retained in history; unavailable.

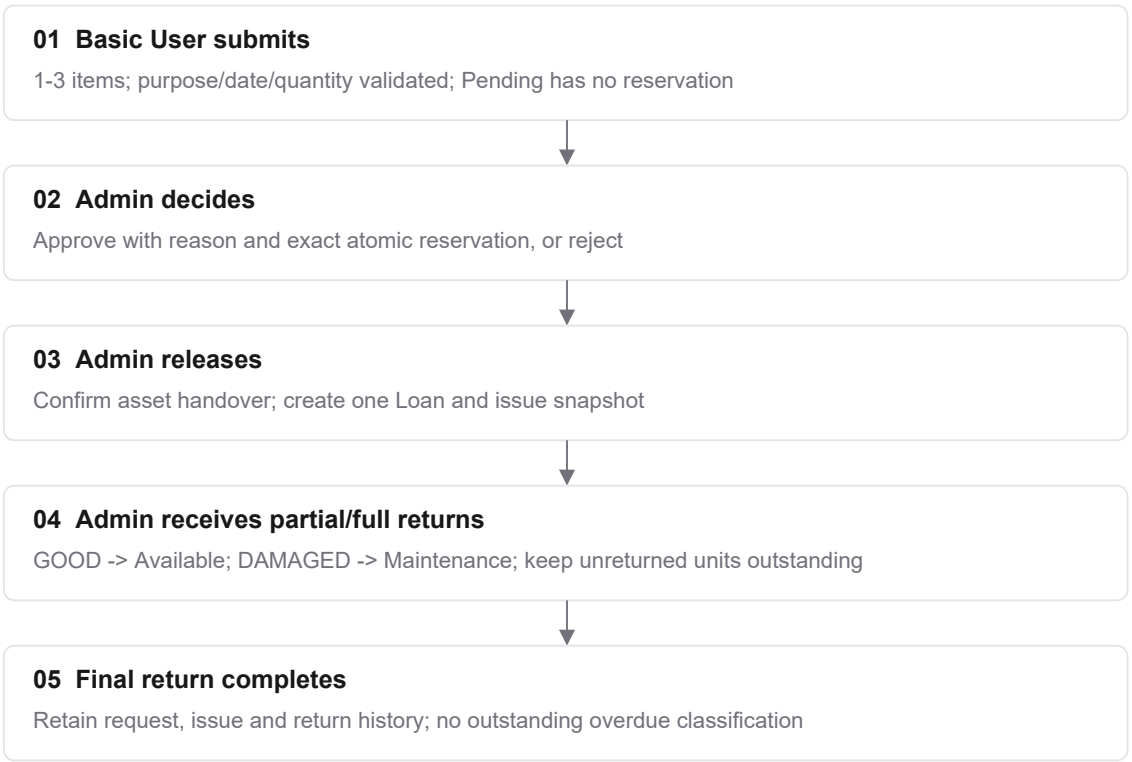

Condition (Good, Fair, Poor or Damaged) is physical metadata, independent of status. Legacy unknown condition/acquisition date can be unrecorded. Return-condition choices are specifically Good / undamaged and Damaged; they are not a free-form replacement for all physical condition values.

5.3 Loan and maintenance labels

Record / label	Meaning and next action
Loan: Active	Outstanding units, not past local due calendar date. Receive permitted returns.
Loan: Partially Returned	Some returns and outstanding units; continue receiving remaining units.
Loan: Overdue	Outstanding after due calendar date; follow up and receive returns. Overdue can take label priority over partial return.
Loan: Completed	No outstanding units; view retained return history.
Maintenance: Reported	Problem recorded; choose Start repair.
Maintenance: In progress	Repair started; update permitted notes or Complete repair.
Maintenance: Repaired	Closed with action/Admin/date; physical unit Available.
Maintenance: Retired	Closed with reason/Admin/date; physical unit Retired/unavailable.

5.4 Borrowing lifecycle diagram

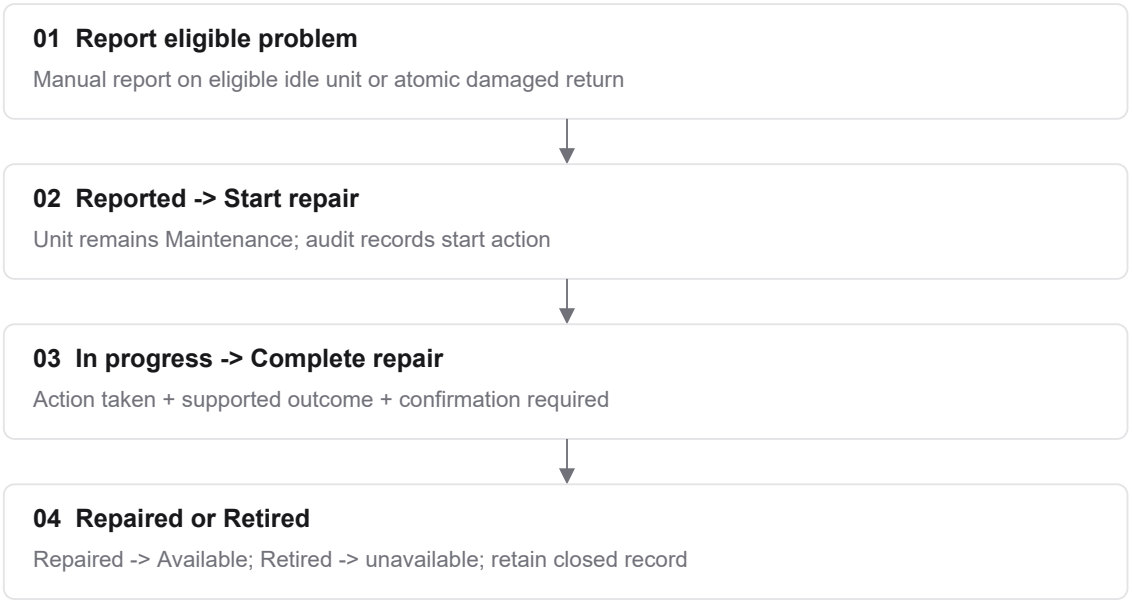

Figure 27. Complete borrowing lifecycle

Pending/Approved cancellation is a branch before release; Approved cancellation frees reservations.

5.5 Maintenance lifecycle diagram

Figure 28. Maintenance and inventory reconciliation

6. Troubleshooting and safe operation

Problem	Action
Cannot log in	Check username/password and server address. An inactive account must be handled by Admin. Do not share passwords or try to forge role fields.
Cannot open Admin page	The campus ADMIN role is required. BASIC_USER, staff or superuser flags alone do not grant portal access.
Equipment unavailable	Read Available rather than only Total Serviceable. Reserved/Issued/Maintenance/Retired stock cannot be requested as available.
Request validation fails	Use 1-3 different items, positive policy-limited quantities, a purpose and future in-policy due date. Recheck stock; correct displayed errors.
Approval conflict / database locked	Another operation may have won. Reload current state and retry an appropriate action; do not directly edit inventory or create duplicate records.
Release unavailable	Check Approved/unissued state, complete Reserved allocations and nonexpired agreement. Use a valid Admin date revision only before issue.
Return refused	Choose outstanding units belonging to that loan and a supported condition; supply notes/confirmation. A returned unit cannot be received twice.
Unit cannot enter maintenance	Reserved/Issued units must finish the borrowing/return workflow. Do not change a status field directly to bypass the rule.
Missing migrated column	Operator: select the intended environment/database and apply included migrations. Do not reset or manually alter the working database as a shortcut.
Empty list/history	Clear filters and inspect the empty-state explanation. Completed history can legitimately be empty; owner scope hides other users.
Old demo dates expired	Operator: create a fresh disposable fictional demo before presentation. Do not disable ordinary date validation or reset operational data.
Source ZIP will not start	Extract it fully, follow README with Python 3.13, install requirements, create private local config/secret and migrate. Do not assume a published clone equals this snapshot.

6.1 Good practice

Use accurate purposes and real physical checks. Return by the agreed date and contact authorized personnel about damage or discrepancies. Protect Admin sessions, downloaded reports, local .env files and demonstration credentials. Archive rather than delete referenced masters. Preserve audit evidence; resolve mistakes through permitted corrections and supervised procedures.

7. Proposed demonstration and readiness checklist

This is a proposed agenda, not a record that a group presentation occurred. Assign actual members only after verifying the roster. Every member needs an identifiable segment and must be prepared to explain their implementation and answer questions. The official specification calls for twelve minutes plus three minutes of Q&A. [R1, p.5]

Time	Suggested demonstration segment	Evidence to show
0:00-1:30	Access/roles and Basic User catalog	Sign-in, owner privacy, public counts/search.
1:30-3:30	Request and validation	Preselection, 1-3 distinct items, invalid duplicate/quantity, Pending/no reservation.
3:30-5:30	Admin review and reservation	Decision reason, exact allocation, conflict/atomicity test evidence.
5:30-7:30	Release and return	Approved review, slip, partial/good/damaged return and outstanding units.
7:30-9:30	Maintenance and overdue	Start/complete repair, unavailable states and calendar-day boundary evidence.
9:30-12:00	Reporting, audit and readiness	Live charts/CSV/settings/audit, test matrix, limitations and team evidence.
12:00-15:00	Q&A	Each member participates; record questions, feedback and agreed follow-up actions.

1. Recreate a fresh isolated fictional demo; privately deliver one Admin and two Basic User credentials through the instructor-designated channel.

2. Run the permanent tests/checks and read the cases marked NOT EXECUTED/BLOCKED. Finish real mobile/assistive and printer checks rather than assuming a screenshot proves them.

3. Complete actual section/roster, contribution/leadership/peer records, acceptance feedback and signed AI/asset disclosure under instructor policy.

4. Use the exact instructor archive naming convention with actual section/group values; retain the requested IT401WProject-Final.zip as the prepared deliverable.

7.1 Screenshot inventory and evidence limits

All eighteen requested screenshot names and eight additional actual views are supplied in docs/screenshots/. The twenty-six images use the same desktop viewport and fictional dataset. No browser-state mockups or fabricated database outcomes are included. A screenshot can show a form ready for an action without proving that action was submitted; corresponding transaction outcomes are established by the exact permanent tests cited in the Test Cases PDF.

Screenshot group	Files
Public / Admin core	01-signin through 12-auditLogs, using the exact requested filenames.
Basic User core	13-userHome through 18-userProfile, using the exact requested filenames.
Supplementary actual views	19-physicalUnits; 20-categoryManagement; 21-userSelectEquipment; 22-userLoanDetail; 23-borrowingSlip; 24-userRequestDetail; 25-userEquipmentDetail; 26-userHistory (all PNG).
